Minerals Yearbook

1975

Volume I

METALS, MINERALS, AND FUELS

U.S. DEPARTMENT OF THE INTERIOR
MARCH 3, 1849

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR ● Cecil D. Andrus, Secretary

BUREAU OF MINES

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities to protect and conserve our land and water, energy and minerals, fish and wildlife, and park and recreation areas, and for the wise use of all those resources. The Department also has a major responsibility for American Indian reservation communities and for the people who live in Island Territories under U.S. administration.

Foreword

The Federal Government, through the Minerals Yearbook and its predecessor volumes, has reported annually on mineral industry activities for 94 years. This edition discusses the performance of the worldwide mineral industry during 1975. In addition to statistical data, the volumes provide background information to assist in interpreting the year's developments. Content of the individual volumes follows:

Volume I, Metals, Minerals, and Fuels, contains chapters on virtually all metallic, nonmetallic, and mineral fuel commodities important to the domestic economy. In addition, it includes a general review chapter on the mineral industries, a chapter on mining and quarrying trends, and a statistical summary.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, and the Commonwealth of Puerto Rico. This volume also has a statistical summary, identical to that in Volume I.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. A separate chapter reviews the international minerals industry in general and its relationship to the world economy.

The Bureau of Mines continually strives to improve the value of its publications to its users. Therefore, the constructive comments and suggestions of readers of the Yearbook will be welcomed.

Director

Acknowledgments

Volume I, Metals, Minerals, and Fuels, of the Minerals Yearbook presents data on more than 90 mineral commodities that was obtained as a result of the mineral information gathering activities of the Associate Directorate —Mineral and Materials Supply/Demand Analysis.

The collection, compilation, and analysis of data on the domestic minerals and mineral fuel industries were performed by the staffs of the Divisions of Ferrous Metals, Nonferrous Metals, and Nonmetallic Minerals, Assistant Directorate—Metals, Minerals and Materials; the Divisions of Coal, Petroleum and Natural Gas, and Fuels Data, Assistant Directorate—Fuels; and the Division of Economic Analysis, Assistant Directorate—Interindustry and Economic Analysis. Statistical data were compiled from information supplied by mineral producers, processors, and users in response to production and consumption canvasses, and their voluntary response is gratefully appreciated. The information obtained from individual firms by means of confidential surveys has been grouped to provide statistical aggregates. Data on individual firms are presented only if available from published or other nonconfidential sources or when permission of the companies has been granted. Other material appearing in this volume was obtained from the trade and technical press, industry contacts, and numerous other sources.

Statistics on U.S. imports and exports, world production, and foreign country trade were compiled in the Office of Technical Data Services. U.S. foreign trade data were obtained from reports of the Bureau of the Census, U.S. Department of Commerce. World production and international trade data came from numerous sources, including reports from the Foreign Service, U.S. Department of State.

The Office of Technical Data Services also provided general guidance on the preparation and coordination of the chapters in this volume and reviewed the manuscripts to insure statistical consistency among the tables, figures, and text, between this volume and other volumes, and between this edition and those of former years.

Acknowledgment is also particularly made of the splendid cooperation of the business press, trade associations, scientific journals, international organizations, and other Federal agencies that supplied information.

The Bureau of Mines has been assisted in collecting mine production data and supporting information by numerous cooperating State agencies. These organizations are listed in the acknowledgments to Volume II.

Review of the Mineral Industries

By Daniel E. Sullivan,[1] Barry W. Klein,[1]
Mary Ann Good,[2] and Alan E. Knight [1]

The recession of 1974 continued into 1975. Real gross national product (GNP), measured in 1972 dollars, declined significantly in the first quarter of 1975 but rose slightly in the second and increased sharply in the third quarter. Unemployment peaked during the second quarter and then declined slowly for the balance of the year. The inflation rate declined owing to reduced demand and smaller-than-1974 increases in energy and food prices early in the year. Recovery was clearly evident by yearend, though unemployment and inflation remained at high levels.

Total output as measured by the GNP in current dollars rose 6.5% in 1975. Real GNP declined 2.0%, and inflation, as measured by the implicit price deflator, increased 8.7%. Real gross private domestic investment for residential structures declined 18.1% in 1975, which was a smaller rate of decrease than the 27% decline in 1974. Real State and local Government purchases increased 2.4%, and real personal consumption expenditures for services rose 1.7%. The Federal Reserve Board (FRB) index of industrial production declined 9.7%.

In 1975 the unemployment rate was 8.5%, which was the highest rate since 1941, up from 5.6% in 1974. The number of people employed declined during the year while the total labor force continued to increase. The unemployment rate reached a peak of 8.9% in May and then declined for the remainder of the year, except September-October, to 8.3% in December.

The Consumer Price Index (CPI) increased 9.1% in 1975, which was less than the 11.0% increase in 1974 but more than in any other previous year since 1947. Food prices rose 8.5% and all nonfood commodities increased 9.2%. The energy price component of the CPI rose 12% in 1975, which, although a high rate, was much less than the 29% advance in 1974. The 1975 increase resulted from the imposition of import fees on crude oil, a 60-cent import fee on refined petroleum products, and the passthrough of higher costs of energy materials by utilities. The wholesale price index increased 9.2% in 1975. Farm products and processed foods and feed increased 3.8%, (farm products alone declined 0.5%), and industrial commodities were 11.5% above their 1974 level. As previously mentioned, the 1975 implicit price deflator rose 8.7% from its 1974 level.

In response to the dilemma of recession and continued inflation in 1975, the FRB sought to ease monetary policy enough to support recovery yet not undermine the fight to lower inflation. The discount rate decreased from 7¾% at the beginning of 1975 to 6% by mid-May and remained at this level for the balance of the year. The money supply M_1, defined as currency plus demand deposits, grew 4.4% in 1975, down from 5% in 1974. M_2, defined as M_1 plus time and savings deposits, increased 8.2% in 1975 as compared with 7.7% in 1974.

Fiscal policy was expansionary in 1975. In late March, the Tax Reduction Act of 1975 was passed, which resulted in an $8 billion rebate of 1974 income taxes paid by individuals. This Act also cut corporate tax liabilities by a gross amount of $4¼ billion. Because of other corporate tax law changes, the net reduction was only $2½ billion. A Federal deficit was projected at $66.4 billion in 1975, but the actual amount was $73.4 billion compared with $11.7 billion in 1974.

---

[1] Economist, Division of Economic Analysis.
[2] Statistical clerk, Division of Economic Analysis.

Total U.S. exports were $11.1 billion greater than imports in 1975, the largest surplus in the post-World War II period. For manufactured products, exports exceeded imports by $22.4 billion and for agricultural products by $12.4 billion. Imports of fuels, and minerals and metals were, respectively, $22.0 billion and $2.2 billion greater than exports.

The Federal Government continued some activities and initiated others in 1975 that affected the minerals sector. The Government continued efforts to reduce inflation. Mineral-related legislation enacted in 1975 was in areas such as energy, taxation, the environment, water, public lands, transportation, and duties. Energy legislation included the elimination of the percentage depletion allowance for oil and natural gas integrated producers; tax legislation affecting fuels; and several measures to improve the U.S. energy position.

Bureau of Mines research programs are designed to foster efficient utilization of our mineral resources, and insure adequate mineral supplies without objectionable environmental, social, and economic effects. During 1975, the Bureau's scientific and technical investigations continued in pursuit of improved mineral technology.

Total energy use in the United States decreased 2.5% in 1975, which was the first 2-year decline since 1945-46. Reasons for this downturn included lowered economic activity, higher fuel prices, a relatively mild winter, and energy conservation efforts. Consumption declined for all energy sources except nuclear power and bituminous coal and lignite. The largest decrease of all major consuming sectors was in industrial energy use. Petroleum (including natural gas liquids) remained as the Nation's largest energy source, supplying 46% of the 1975 total. Despite work stoppages and continuing productivity declines, production of bituminous coal and lignite continued to increase.

In 1975, the mining industry faced environmental problems, uncertainties, and, in general, higher mining costs. Plans for developing new mining operations and expanding existing ones were, in many cases, canceled or delayed. Production in the ferrous and nonferrous metals sectors declined in response to reduced demand. The shortages of materials, supplies, equipment, and manpower, present in 1974, ameliorated in 1975.

The world economy turned upward in 1975, overcoming the most serious recession since the Great Depression. Inflation rates moderated relative to the 1972–74 period but remained at high levels by historical standards. The fourfold increase in world oil prices that occurred in 1974 continued to cause some major economic dislocations in the developed oil consuming nations in 1975, but the less developed oil importing countries faced the most severe balance of payment problems. Capital investment, which could be used to increase world production of goods and services, has instead been diverted to replace equipment made obsolete by high, rapidly rising energy prices.

SOURCES AND USES

ALL MINERALS

Production.—In 1975 domestic raw mineral production was valued at $62.3 billion, a 13% increase over the 1974 figure. Production of mineral fuels increased 16%, nonmetals rose 10%, and metals declined more than 6%. In constant 1967 dollars the total raw mineral output value declined over 5% from $26.1 billion in 1974 to $24.6 billion in 1975; metals and nonmetals declined 11% and 12%, respectively, and mineral fuels declined 2%. Total mineral raw material exports rose 32% to $4.7 billion, and imports increased 17% to $22.7 billion.

The decline in physical output of minerals as part of the general economic recession is reflected in the Bureau of Mines indexes of the physical volume of mineral production (1967=100). With the exception of coal, all of the indexes showed declines. The overall index declined about 6% to 103.9 index points. The metal index declined almost 10%; the nonmetal index, almost 12%; and the fuel index, 3%. The ferrous and nonferrous metal indexes declined about 11% and 9%, respectively. The base metal index, which with the monetary index and the other nonferrous metal index make up the nonferrous metal index, also declined about 10%. The monetary metal and other nonferrous metal indexes declined less than 1% and 3%, respectively. The construction and other nonmetal indexes declined almost 14% and 15%, respectively. The chemical index declined less than 5%. As mentioned previously, the coal index increased. However, its almost 7% increase was not enough to offset the over 5% decline in the more heavily weighted crude oil and natural gas index, which caused the overall fuel index to decline.

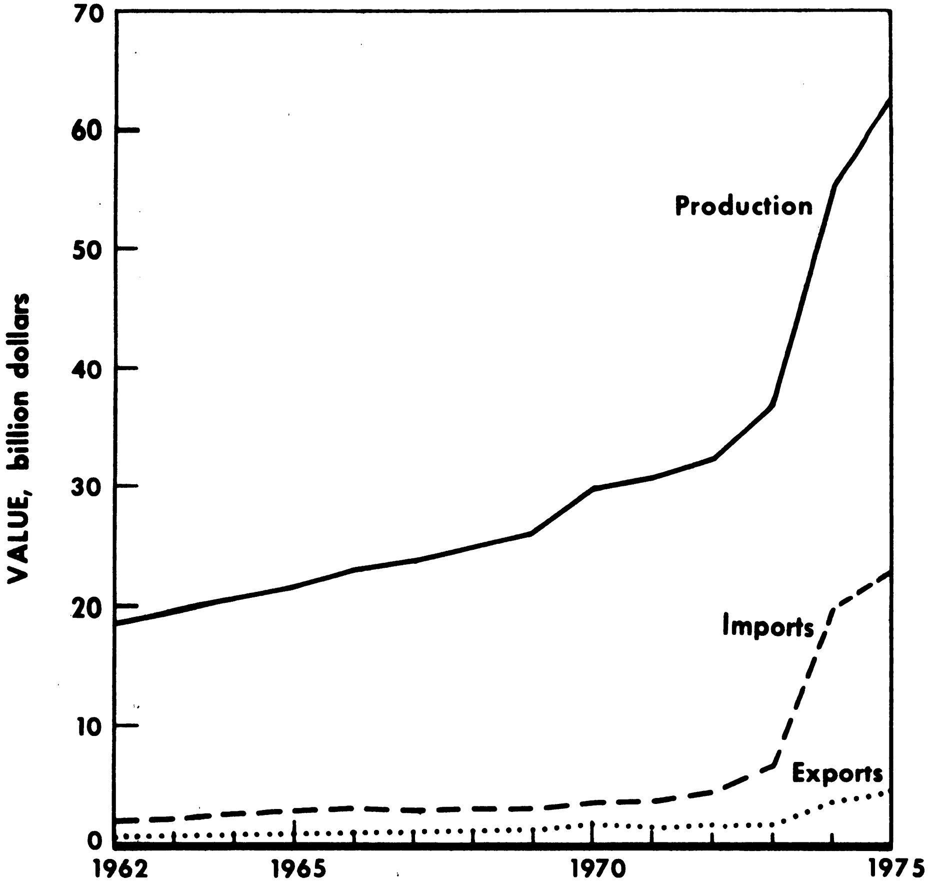

Figure 1.—Value of raw mineral production, exports, and imports.

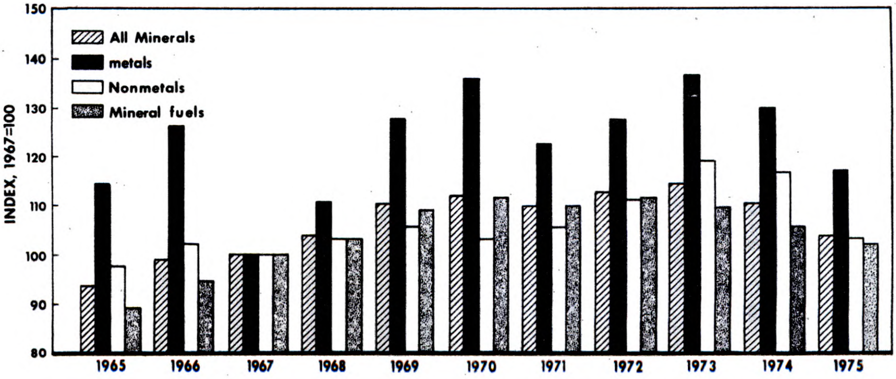

Figure 2.—Indexes of physical volume of mineral production in the United States, by group.

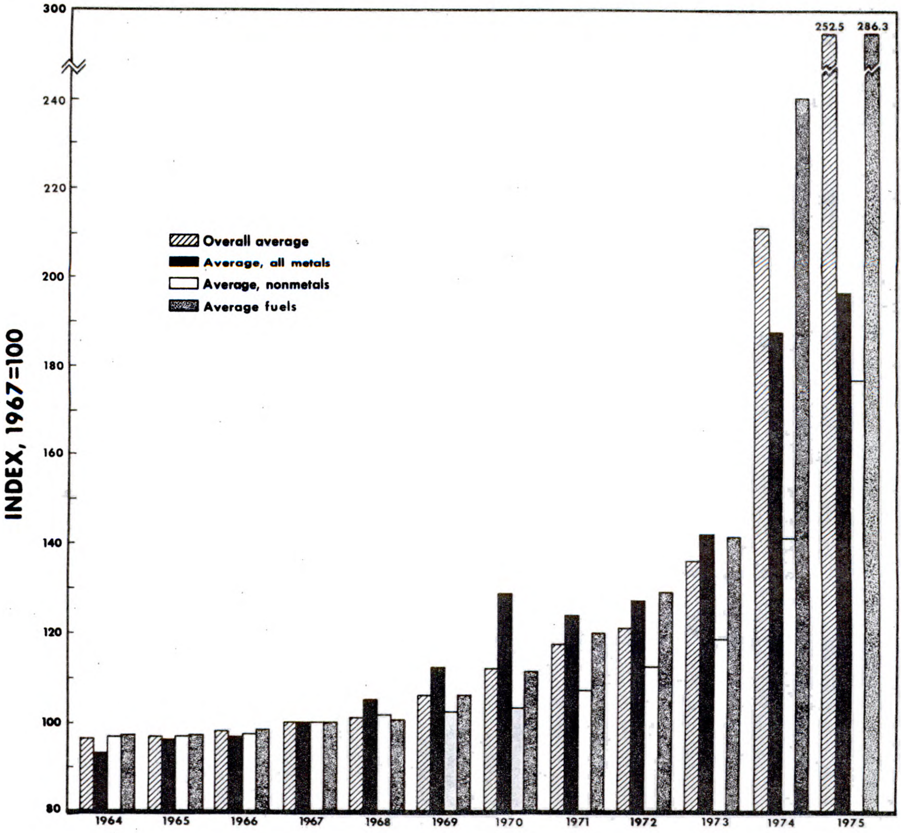

Figure 3.—Indexes of implicit unit value.

The FRB index of industrial production (1967=100) for all industries declined almost 9% to 113.7 index points in 1975. The average for all mining declined more than 2% to 106.6 index points. The average index for the production of metal, stone, and earth minerals declined over 6% to 109.8 index points. The metal index declined just less than 6% to 121.7 index points, and the stone and earth minerals index declined less than 7% to 101.7 index points. The average index for the production of coal, oil, and gas declined over 1% to 105.8 index points. The production index for coal increased more than 8% to 113.8 index points, but the average index for crude oil and natural gas declined almost 3% to 104.5 index points.

The production index for primary metals declined almost 22% to 97.0 index points. The iron and steel production index declined 20% to 95.9 index points, and the nonferrous metals and products index declined over 24% to 99.3 index points. The clay, glass, and stone products index declined over 13% to 108.8 index points.

The FRB average production index for all mining by month was 107 index points in January. It increased to near 109 index points in February and remained near 109 the next 2 months. It declined to near 106 index points in May, where it remained for the next 2 months. It declined to 105 index points in August then gradually increased until it reached almost 107 points in November. In December it declined to near 105 index points. The monthly index of production for coal, oil, and gas followed a similar pattern. It was near 104 index points in January, increased to near 108 in March, and declined to less than 106 in May. In June it was again close to 108, declined to near 104 in August, and increased to near 106 in October where it remained until December when it was below 105 index points. The individual coal index and oil and gas extraction indexes also followed similar patterns. The metal, stone, and earth minerals index was near 119 in January, dropped almost to 113 in March, to near 106 in May, and to slightly above 101 in June. In July it rose to 105 and for the next 2 months remained near 107. It increased to 110 in November and declined to near 108 in December. The individual indexes of metal mining and stone and earth mineral mining generally followed similar patterns through the year.

The net supply for most principal metals and nonmetals declined during 1975. The net supply for all but two ferrous metals declined: Iron ore, pig iron, and steel ingot decreased by more than 8%, 17%, and 19%, respectively; cobalt declined 48%; tungsten, 40%; chromite, 9%; and nickel, 5%. Manganese increased by almost 52% and molybdenum almost 14%. The net supply of all nonferrous metals except tin declined. Platinum-group metals and cadmium had the largest decline at 42% and 40%, respectively. Aluminum, zinc, and antimony showed decreases in the range of 20% to 22%; copper, 9%; and uranium concentrate, 7%. Lead, mercury, and ilmenite and slag showed declines from 1% to 6%. Tin increased by 12%. The net supply of all but two nonmetals declined or showed no change. Talc and allied minerals experienced the greatest decline at 27%, followed by asbestos at 26%, finished fluorspar at 22%, and clays at 20%. Crushed stone, sand and gravel, gypsum, common salt, and potash all declined by percentages in the teens. Bromine decreased 6%; sulfur, 2%; and mica showed no change. The net supply of phosphate rock rose almost 14% and that of crude barite increased 5%.

Stocks and Government Stockpiles.—Stocks of crude nonfuel minerals at primary producers, as illustrated by the Bureau of Mines index (1967=100), rose for all but one category in 1975. The overall index increased 27% and the metals index increased 16%. Within the metals sector, the iron ore index increased 23%, the nonferrous index increased 2%, and the other ferrous index declined 20%. The largest gain in the crude mineral category was for nonmetals, which rose almost 37%. The Bureau of Mines index of stocks of nonfuel minerals at manufacturers, consumers, and dealers (1967=100) also increased in all but one category, though the overall increase, at 13%, was considerably smaller than that for crude minerals. The metals sector index increased almost 14% and all metal subgroups showed increases. Other ferrous increased over 29%, followed by iron at under 18%, base nonferrous at less than 17%, and other nonferrous at almost 1%. Unlike producer stocks where nonmetals showed the largest increase of all groups and subgroups, the nonmetals declined 9% for mineral manufacturing consumers and dealers.

Producer stocks of bituminous coal and lignite increased by one-third during 1975. Those of coke increased fivefold, reflecting lower consumption by the steel industry. Stocks of most petroleum and related products also increased with three exceptions: Carbon black, which declined over 21%; natural gasoline, plant condensates, and isopentane, which declined over 2%; and special naphthas, which declined over 23%. Stocks of crude petroleum and petroleum products increased almost 6%. Stocks of all of its constituents, except special naphthas as mentioned previously, also increased. Crude petroleum stocks increased over 2%; gasoline, almost 8%; liquefied gases, almost 8%; distillate fuel oil, over 4%; residual fuel oil, over 24%; petroleum asphalt, almost 7%; and the other products category, nearly 3%. Stocks of natural gas increased almost 8%.

The seasonally adjusted book value of product inventories increased for all but one of the selected mineral processing industries during 1975. Petroleum and coal products increased almost 10% to $4,313 million, as of December 1975. Stone, clay, and glass products declined over 2% to $3,630 million after having increased over 32% during 1974. Total primary metals inventories increased over 17% to $13,924 million. Blast furnace and steel mill inventories increased almost 33% to $7,627 million, and other primary metals inventories increased 3% to $6,297 million. The total seasonally adjusted book value of inventories for selected mineral processing industries increased over 12% to $21,867 million during 1975.

Of continuing importance to the mineral industry were U.S. Government inventories of basic stockpile materials. Materials on hand as of December 31, 1975, with high market values included bauxite, chromium, diamond, lead, manganese, silver, tin, tungsten, and zinc.

Exports.—The total value of selected minerals and mineral products exported during 1975 increased almost 10%. Only the two metal sectors did not increase. Exports of crude and scrap metals declined a little more than 8% and those of manufactured metals declined over 7%. Crude nonmetallic mineral exports increased over one-third. Exports of mineral energy resources and related products increased over 30%; those of chemicals, over 16%; and those of manufactured nonmetallic minerals, almost 10%.

The general pattern of the geographic distribution of exports of selected mineral commodities remained generally stable in 1975. For some commodities the export distribution pattern did change. For example, in the case of iron and steel ingots and other primary forms, the share of exports to North America increased 27 percentage points to 62%, that of South America decreased 20 percentage points to 15%, and that of noncentrally planned Asia declined 11 percentage points to 4%. In the case of silver, platinum, and platinum-group metals, the share of exports to North America were 22 percentage points less and to noncentrally planned Asia were 12 percentage points less than in 1974, and the percentage exported to noncentrally planned Europe was double what it had been in 1974. The share of zinc and zinc alloy exports that went to South America declined from one-third to one-fifth, that to noncentrally planned Asia declined from 19% to 6%, and that to noncentrally planned Europe increased from 30% to 52%. The change in the pattern of tin and tin alloys exports was an upward shift in the shares to North America and South America of 35 percentage points to 55% and 18 points to 24%, respectively, and a shift downward for noncentrally planned Europe of 54 points to 17%. The distribution of exports of uranium and thorium and their alloys shifted away from North America, down 15 percentage points, to 26%; away from noncentrally planned Europe, down 20 percentage points, to 28%; toward noncentrally planned Asia, up 26 points to 34%; and to Oceania, up from zero to 12%.

Imports.—The total value of selected minerals and mineral products imported during 1975 decreased almost 2% from the high 1974 levels. This was caused by declines in imports in the manufactured nonmetallic minerals sector of 16% and the manufactured metals sector of 22%. In all other sectors the value of imports increased. The value of crude nonmetallic minerals imported increased just over 1%; those of crude and scrap metals, almost

7%; those of mineral energy resources and related products, over 4%; and chemicals, over 19%.

The general geographic distribution pattern for imports of selected mineral commodities remained generally stable during 1975. However, as was the case for exports, the pattern did change for some commodities. Imports of phosphates, crude and apatite, were all from North America, while in 1974 noncentrally planned Asia and Africa supplied 10% and 16%, respectively. The percentage of mica, including scrap, imports from North America and noncentrally planned Asia increased and that from South America declined. The share of copper ores and concentrates from North America increased, and those from South America and noncentrally planned Asia declined. The shares of tin waste and scrap from North America and noncentrally planned Asia declined 64 percentage points to 8% and 21 percentage points to 1%, respectively; that from noncentrally planned Europe increased 85 percentage points to 91%. The shares of platinum-group metal ores, concentrates and waste imports from North America and South America increased, and those from noncentrally planned Europe and Asia declined.

Consumption.—In 1975 consumption of most major mineral products dropped significantly. All selected ferrous metals showed declines. Raw steel consumption declined almost 20%, and iron ore consumption decreased over 17%. Metallurgical-, refractory-, and chemical-grade chromite ores decreased at rates of 41%, 38%, and 34%, respectively, the largest declines of all ferrous metals. Molybdenum consumption fell almost 19%; tungsten, 14%; and manganese ore, 3%. Consumption of all major nonferrous metals declined with the exception of estimated private purchases of uranium, which increased 5%. Refined copper consumption declined 30%; primary antimony, 28%; all classes of zinc, more than 26%; and platinum, almost 34%. Apparent consumption of aluminum, primary and secondary lead, and ilmenite and titanium slag declined at rates between 19% and 21%. Primary mercury decreased 15%, and industrial consumption of silver declined 10%. Consumption of all selected major nonmetals declined. Phosphate rock showed the largest decline at 31%, followed by asbestos at 28%, and sand and gravel and clays both at 19%. Potash, crushed stone, cement, and salt decreased at rates between 13% and 17%. Lime consumption declined over 11% and sulfur fell 2%.

Total energy resource inputs in terms of British thermal units (Btu) declined almost 3%. Bituminous coal consumption increased, anthracite remained unchanged, and natural gas and petroleum including natural gas liquids fell. Total net electricity generation increased. In the utilities sector, electricity generation at conventional fuel-burning plants and at hydropower plants declined, while that at nuclear power plants increased by half. Industrial electricity production declined.

ENERGY

Energy use in the United States decreased in 1975 for the second year in a row. The 2.5% decline from 1974 was largely attributable to the 6% decrease in energy use by the industrial sector that, in turn, was caused by lowered economic activity, higher fuel prices, and greater energy conservation. Net imports of all fuels fell 4.4% on a Btu basis from 1974 levels, accounting for 16.1% of 1975 total gross energy use—about the same as in 1974. Consumption on a Btu basis declined for all energy sources with the exception of nuclear power. There was a 2% decrease in per capita energy use and the ratio of energy use to GNP declined slightly in 1975. This ratio of energy use to GNP has declined since 1971, indicating the U.S. economy is using energy more efficiently to create GNP.

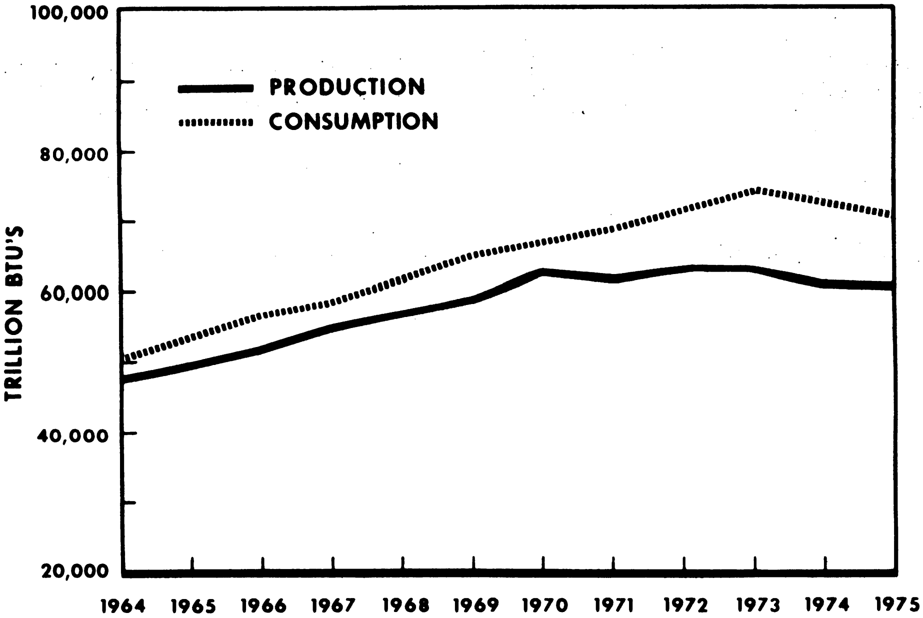

Figure 4.—Production and calculated gross consumption of mineral energy resources and electricity from hydropower and nuclear power.

Production.—Total production of mineral energy resources and electricity from hydropower and nuclear power in 1975 declined almost 2% to 60,135 trillion Btu. All sources of energy production declined except bituminous coal and lignite, which increased 6% but accounted for 25% of total production, and nuclear power, which increased 51% but accounted for only 3% of total production. Anthracite declined 6%; natural gas, 7%; petroleum, almost 5%; and hydropower, a negligible amount.

Consumption.—In 1975 U.S. energy consumption declined almost 3% to 70,558 trillion Btu. Consumption of all energy resources declined except for electricity from nuclear power, which increased 51%. Anthracite consumption fell almost 6% in terms of Btu's; bituminous coal, less than 1%; and coke, over 76%. Petroleum consumption dropped 2%; natural gas, more than 8%; and natural gas liquids, almost 4%. Consumption of electricity from hydropower declined more than 2%.

In 1975 the household and commercial sector received 43% of its energy input from natural gas, 33% from petroleum, 23% from electric utilities, and the remaining 1% from coal. For industrial users, the corresponding shares were approximately 42%, 27%, 13%, and 18%. Petroleum accounted for almost 97% of transportation's energy consumption. Energy input to electric utilities was 43% from bituminous coal and lignite, 16% each from petroleum, natural gas, and hydropower, and 9% from nuclear power.

Coal.—In 1975 the domestic supply of anthracite declined more than 6% to 5.1 million tons; that of bituminous coal and lignite increased less than 1% to 556 million tons. Exports of anthracite declined almost 7% and those of bituminous coal rose almost 10%; bituminous coal imports decreased 55%. The household and commercial sector accounted for about 44% of anthracite consumption, and the remainder was almost equally divided between electric utility power generation and industrial uses. Electric utilities accounted for 73% of bituminous coal consumption, and industrial uses, for another 26%.

Natural Gas.—The domestic supply of natural gas declined 8% in 1975 to 19,538 billion cubic feet. Domestic production continued to decline, dropping to 19,236 billion cubic feet or 7% below the 1974 level. Exports declined over 5% and imports decreased less than 1%. Net stock additions rose more than 300%. Demand for natural gas declined 15% in the industrial sector, rose 1% in the household and commercial sector, and declined in the other consuming sectors.

Petroleum.—The domestic supply of crude oil in 1975 increased almost 3% to 4,541 million barrels. Domestic production continued to decline, falling to 3,057 million barrels, which represented a decrease of almost 5% from the 1974 figure. An 18% increase in imports contributed to the larger 1975 supply. Exports and stocks remained negligible. The domestic supply of refined petroleum products declined 2% to 5,954 million barrels. The demand for petroleum declined in all consuming sectors except transportation, which increased 1% and accounted for over 62% of all petroleum consumed.

Nuclear Energy.—In 1975 nuclear energy consumption was 51.4% greater than that of 1974. In terms of Btu's it rose from 1.7% of total energy consumption in 1974 to 2.6% of the total in 1975.

Hydropower.—Consumption of hydropower in 1975 declined 2.4% from the 1974 figure. Hydropower accounted for 4.6% of U.S. total energy consumption in 1975, the same as that of 1974.

Other Energy.—The search for alternate energy sources continued during 1975. Under development were geothermal, oil shale, solar, wind, nuclear fusion, tidal, and biological (from organic wastes) sources. World output of geothermal energy was double what it had been in 1972. The United States was the largest producer of geothermal power, all of which was produced at one site. Because of economic, technical, geologic, and environmental factors, additional development of geothermal power on federally leased lands in 1975 was minimal. Oil shale development proceeded, in spite of problems involving high costs and environmental concerns. The other alternate sources of energy remained minor or theoretical, but there was strong interest in the development and expansion of solar, wind, and fusion power into significant energy sources.

EMPLOYMENT AND PRODUCTIVITY

Employment.—Employment in selected mineral industries changed in a mixed pattern during 1975. Total mining employment increased almost 11% to 744,900. Metal mining employment was unchanged at 92,300, although employment in iron mining increased over 2% and employment in copper mining declined over 13%. Nonmetal mining and quarrying employment declined over 3% to 115,100. Total employment in the fuel industries increased almost 17% to 537,500. Employment in coal mining increased about 20%, employment in crude petroleum and natural gas fields increased 11%, and employment in oil and gasfield services increased almost 19%.

Total mineral manufacturing employment declined almost 8% to 888,400 during 1975. Nonfuel mineral manufacturing employment declined 10% to 691,000. Employment at fertilizer plants (complete and mixing), blast furnaces, steelworks and rolling mills, and nonferrous smelting and refining plants all declined about 10%; employment in the hydraulic cement industry declined over 7%.

Hours and Earnings.—Average hourly earnings in the extractive industries increased more than 10% to $5.42 for nonfuels, and almost 14% to $6.14 for fuels. Hours worked declined more than 2% in the nonfuels industry, but increased almost 1% in the fuels industry. The resulting increases in weekly earnings were more than 7% for nonfuels and almost 15% for fuels. Within the nonfuels industry, average hourly earnings increased about 13% to $6.13 for metal mining and more than 7% to $4.85 for nonmetallic mining and quarrying. As weekly hours declined over 2% in metal mining, weekly earnings only increased about 10%. In the nonmetallic mining and quarrying industry, weekly hours declined 6% causing weekly earnings to increase less than 1%. Within the metal mining sector, iron ores showed average hourly earnings increasing more than 14% to $6.34, average weekly hours declining almost 2%, and average weekly earnings increasing more than 12%. Copper ores showed average hourly earnings increasing almost 15% to $6.33, average weekly hours decreasing almost 5%, and average weekly earnings increasing almost 10%. Within the extractive fuels industries, average hourly earnings in coal mining increased more than 16% to $7.21, average weekly hours increased nearly 3%, and average weekly earnings increased almost 20%. Average hourly earnings in the crude petroleum and natural gas industries increased over 13% to $6.05, average weekly hours declined nearly 3%, and average weekly earnings increased over 11%.

For all manufacturing, hourly earnings increased over 11% to $6.71 during 1975, weekly hours declined almost 4%, and weekly earnings increased 7%. Weekly hours declined for all of the selected mineral manufacturing industries. Hourly earnings for the fertilizer industry (complete and mixing) increased almost 11% to $4.43, weekly hours declined over 1%, and weekly earnings increased less than 10%. For the hydraulic cement industry, hourly earnings increased over 7% to $6.33, weekly hours declined almost 2%, and weekly earnings increased less than 6%. Hourly earnings in the blast furnaces, steel and rolling mills industry increased more than 11% to $7.11, weekly hours declined just over 5%, and weekly earnings declined almost 6%. Hourly earnings in the nonferrous smelting and refining industry increased almost 11% to $5.96, weekly hours declined over 3%, and weekly earnings increased over 7%. In petroleum refining and related industries hourly earnings increased 14% to $6.42, weekly hours declined nearly 2%, and weekly earnings increased nearly 12%. In petroleum refining, hourly earnings increased almost 16% to $6.89, weekly hours declined just over 2%, and average weekly earnings increased just over 13%. Hourly earnings for other petroleum and coal products increased almost 10% to $5.03, weekly hours declined almost 2%, and weekly earnings declined just under 8%.

Wages and Salaries.—During 1975 total wages and salaries for all industries increased over 5% to $806.7 billion. In the mining sector the increase was over 21% to $10.7 billion, and in the manufacturing sector total wages increased only slightly to $211.7 billion. The 1974 figures, which were not available last year, show total wages and salaries for all industries increasing 9% to $764.5 billion; those in the mining sector, increasing over 21% to $8.8 billion; and those in the manufacturing sector, increasing almost 8% to $211.4 billion. During 1975 the average earnings of full-time employees in all industries increased almost 9% to $10,892; in the mining sector, the increase was almost 14% to $14,647; and in the manufacturing sector, the increase was about 10% to $11,941. These figures also were not available in 1974. During 1974 average earnings of full-time employees in all industries increased almost 8% to $10,004; in the mining sector, the increase was over 10% to $12,896; and in the manufacturing sector, the increase was over 8% to $10,845.

Labor Turnover Rates.—The total accession rate (hires and rehires) for the manufacturing sector declined almost 12% during 1975. Six of the nine selected mineral industries also showed declines in their accession rates. The accession rate for hydraulic cement increased over 93%, the rate for blast furnaces, steel and rolling mills increased 40%, and the rate for coal mining increased over 21%. Those showing declines in accession rates were iron ores, over 11%; petroleum refining and related industries, almost 22%; metal mining, almost 23%; petroleum refining, over 29%; nonferrous smelting and refining, over 33%; and copper ores, almost 41%.

The total separation rate for the manufacturing sector declined more than 12% during 1975. Six of the nine selected mineral industries showed increases in their separation rates. They were hydraulic cement, over 86%; blast furnaces, steel and rolling mills, almost 83%; iron ores, almost 29%; nonferrous smelting and refining, over 15%; coal mining, almost 8%; and metal mining, over 3%. The separation rate for copper ores remained unchanged. The rate for petroleum refining declined 20%, and that for petroleum refining and related industries declined almost 21%.

The layoff rate for the manufacturing sector increased 40%. The layoff rate increased substantially for all of the six selected nonfuel mineral industries. It more than quadrupled for the blast furnaces, steel and rolling mills industry, the nonferrous smelting and refining industry, and the copper ore industry; the layoff rate more than tripled for the hydraulic cement industry, the metal mining industry, and the iron ore industry. The layoff rate remained unchanged in petroleum refining and related industries and the coal mining industry, and it declined 25% in the petroleum refining industry.

Productivity.—The indexes of labor productivity for selected mineral industries during 1974 (latest data available) all declined. The index of crude copper ore mined per employee declined over 7%, per production worker the index declined over 6%, and per production worker man-hour it declined over 3%. The same indexes for recoverable copper metal declined over 12%, almost 11%, and over 8%, respectively. The indexes of crude iron ore mined per employee and per production worker each declined over 5%, and the per production worker man-hour index declined almost 7%. For usable iron ore mined, the first two indexes declined almost 9% and the last index, almost 10%. The indexes for refined petroleum per employee, per production worker, and per production worker man-hour declined about 5%, 6%, and almost 7%, respectively. Those for bituminous coal and lignite declined about 7%, 6%, and 2%, respectively.

PRICES AND COSTS

Index of Average Unit Mine Value.—The index of average unit mine value (1967=100) is designed to reflect the unit values of mine production. It shows the unit mine values of most minerals increasing during 1975; only the base and monetary nonferrous metals indexes declined. The total index of average unit mine value increased almost 18% to 252.9 index points. The metal index increased 12%; the nonmetal index, over 23%; and the fuel index, over 17%. The ferrous metal index increased 30%. The nonferrous metal index declined just over 3%, reflecting an almost 12% decline in the base nonferrous metal index and an almost 10% decline in the monetary metal index. The other nonferrous metals index increased over 42%. In the nonmetallic mineral sector, the construction index increased about 16%, the chemical index increased over 52%, and the other nonmetals index increased almost 16%. In the fuels sector, both the coal index and the crude oil and natural gas index increased over 19%.

Index of Implicit Unit Value.—The index of implicit unit value (1967=100) is designed to reflect the unit values of the minerals included in the index of the physical volume of mineral production. For 1975 it reflects the same pattern of price changes as the aforementioned index of average unit mine value. With the exception of base and monetary nonferrous metals the indexes all increased. The total index of implicit unit value increased over 19% to 252.5 index points. The metal index increased almost 5%; the nonmetal index, about 25%; and the fuel index, about 19%. The ferrous metal index increased almost 30%. The nonferrous metal index declined over 6%, reflecting an almost 13% decline in the base nonferrous metal index and an over 3% decline in the monetary metal index. The other nonferrous metals index increased over 45%. In the nonmetallic mineral sector, the construction index increased 16%, the chemical index increased 57%, and the other nonmetals index increased almost 17%. In the fuels sector, the coal index increased just over 19% and the crude oil and natural gas index increased over 20%.

Prices.—In 1975 wholesale price indexes for selected metals, minerals, and fuels increased at significantly lower rates than those in 1974. The index for all commodities increased over 9%, less than half the 1974 rate; for commodities other than farm and food it increased 11.5%, also nearly half the 1974 rate. The index for metals and metal products increased 8%, nearly a quarter of the 1974 rate. Not only were the rates of increase lower than those in 1974, but several indexes in the metals and metal products categories actually decreased. Iron and steel scrap decreased 30%, to 254.6; nonferrous scrap decreased 35%, to 128.3; nonferrous metals decreased over 8%, to 171.6; and common pig lead decreased over 3%, to 154.0. Metals and metal products increasing significantly were the following: Iron ore, 25%; semifinished steel products, over 22%; finished steel products, over 15%; foundry and forge shop products, 20%; pig iron and ferroalloys, nearly 41%; and primary metal refinery shapes, about 63%.

The overall index for nonmetallic mineral products increased about 13% to 174.0, with many of the indexes for nonmetallic mineral products increasing at about the same rate. Exceptions included the following: Gypsum products, which increased the least, less than 5%; phosphate rock increased the most, 133%; phosphates, nearly 100%; nitrogenates, 40%; fertilizer materials, over 60%; and potash and insulation materials, over 25%. The price index for fuels and related products and power increased about 18%; price indexes for most selected fuels increased at about this rate. Exceptions included the following: Anthracite, which increased over 50%, and coke and gas fuels, which both increased by about one-third.

Prices of mineral energy resources continued to increase in 1975 with the exceptions of Bunker C residual fuel oil at all gulf ports and No. 2 distillate, which decreased from $10.28 to $9.30 per barrel, and from 30.69 cents to 28.43 cents per gallon, respectively. The average price of bituminous coal at merchant coke ovens increased at the largest rate, nearly 54% to $52.63 per short ton; average sales realization prices for anthracite increased between 35% and 43% to between $38.40 and $42.15 per ton. Average prices of residual fuel oil, after doubling in 1974, remained fairly stable; No. 6 fuel, maximum 1% sulfur, was $12.26 per barrel, up from $11.95; No. 6 fuel, maximum 0.3%, at Philadelphia, was $13.16 per barrel, up only $.05 from 1974. The average price of No. 2 distillate fuel oil at Philadelphia increased over 16% to 29.19 cents per gallon. The average value at the well for natural gas increased over 43% to 43.5 cents per thousand cubic feet, and at the point of consumption almost 30% to $1.15 per thousand cubic feet.

During 1974 (latest data available) the average cost of electricity increased sharply owing to the higher price of imported oil. Of all the regions, New England price increases were the greatest, reflecting the dependence on imported oil. The cost of residential electricity increased over 35%, raising the average price to 4.2 cents per kilowatt-hour. Commercial and industrial electricity prices increased over 43% to 3.3 cents per kilowatt-hour. The Middle Atlantic region experienced similar price increases as did Alaska and Hawaii. In the East South-Central region the cost of electricity was the lowest, partly due to the influence of the Tennessee Valley Authority (TVA). The nationwide average cost of electricity increased 0.4 cents per kilowatt-hour for residential as well as commercial and industrial electricity, raising prices to 2.8 cents per kilowatt-hour and 2.0 cents per kilowatt-hour, respectively.

Principal Metal Mining Expenses.—The index of principal metal mining expenses (1967=100) increased 14% to 196 index points. The labor component increased at about the same rate to 205 index points, and the supply component increased less than 13% to 177 index points. The fuel component increased almost 18% to 245 index points, and the electrical energy component increased more than 18% to 193 index points.

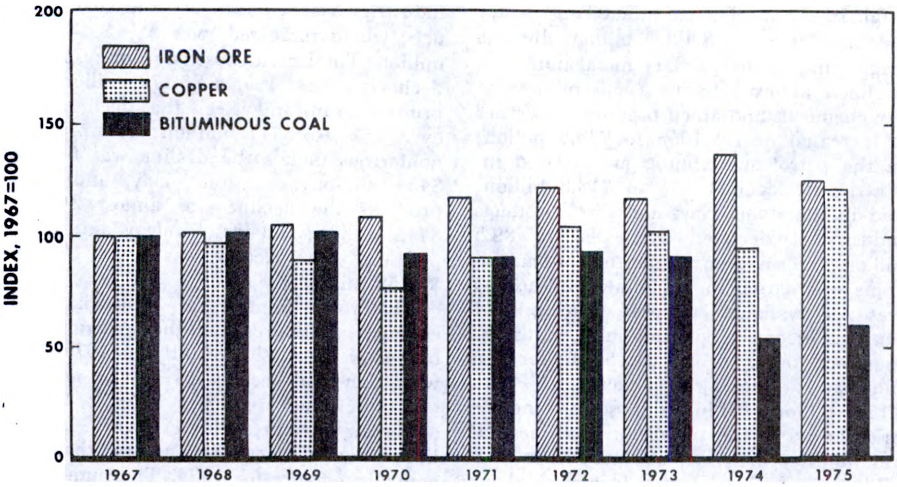

Figure 5.—Index of labor costs per dollar of product.

Costs.—The 1975 indexes of relative costs and productivity (1967=100) in general showed increases in labor costs per unit of output and mixed changes in both the value of product per man-period and labor costs per dollar of product. For iron ore, the index of labor costs per unit of output and the index of value of product per man-period both increased strongly but the index of labor costs per dollar of product declined. For copper, the index of labor costs per unit of output increased and the index of value of product per man-period declined. The index of labor costs per dollar of product increased significantly. For bituminous coal, the index of labor costs per unit of output increased significantly, and the index of value of product per man-period increased moderately. The index of labor costs per dollar of product increased slightly. The petroleum indexes of labor costs per unit of output rose 22% in 1974 (latest data available), the value of product per man-period increased by 58%, and the index of labor costs per dollar of product declined almost 30%.

The 1975 price indexes for mining construction and material handling machinery and equipment (1967=100) all increased significantly. The index for portable air compressors and the index for mixers, pavers, spreaders, etc., both increased about 13%. The indexes for construction machinery and equipment; power cranes, excavators, and equipment; scrapers and graders; and tractors other than farm each increased by more than one-fifth. The indexes for oilfield machinery and tools and specialized construction machinery both increased about one-fourth. Mining machinery and equipment again increased the most, at 28%.

INCOME AND INVESTMENT

National Income Generated.—National income originating in all industries was $1,236 billion in 1975, a more than 7% increase above that of 1974. National income originating in the mining sector increased more than 22% to $18.8 billion. The largest share of income originating in the mining sector was from the crude petroleum and natural gas industry. It was $8.2 billion, almost 24% greater than that of 1974. Income originating in the coal mining sector, $6.7 billion, was almost 30% greater than that of 1974. Income from the mining and quarrying of nonmetallic minerals increased over 2% to $2.1 billion, and income in the metal mining sector increased 10% to $1.7 billion. Income originating in the manufacturing sector increased 4% to $309.9 billion. Income originating in the primary metal industries declined almost 7% to $26.0 billion; in the chemicals and allied products industries it increased nearly 10% to $23.8 billion; in the petroleum refining and related industries it declined 2% to $13.8 billion; and in the stone, clay, and glass products industry it declined over 2% to $9.5 billion. Information relating to national income originating in the mineral industries was not available last year. During 1974 national income originating in all industries increased over 7% to $1,152 billion. In mining it increased almost 52% to $15.4 billion. Within this sector, income originating in the petroleum and natural gas industry increased about 69% to $6.6 billion; in coal mining it increased about 81% to $5.2 billion; in the nonmetallic sector it increased over 10% to $2.1 billion; and in metal mining it increased over 3% to $1.5 billion. Income originating in the manufacturing sector increased over 5% during 1974 to $298.2 billion. Income originating in the primary metal industries increased almost 28% to $28.0 billion; in the chemicals and allied products industry it increased over 6% to $21.7 billion; in the petroleum refining and related products industry it increased almost 65% to $14.1 billion; and in the stone, clay, and glass products industry it declined almost 1% to $9.7 billion.

Profits and Dividends.—The average annual profit rate on shareholders' equity in all manufacturing industries decreased more than 3 percentage points during 1975 to 11.6%. All of the selected mineral manufacturing industries showed substantial decreases in profit rate. The profit rate for primary metals decreased almost 8 percentage points to 8.5%; that for primary iron and steel decreased over 6 percentage points to 10.7%; that for primary nonferrous metals declined over 10 percentage points to 5.2%; that for stone, clay, and glass products declined almost 4 percentage points to 6.8%; for chemicals and allied products it declined over 3 percentage points to 15.2%; and for petroleum and coal products it declined over 8 percentage points to 12.5%.

Total dividends for all manufacturing increased almost 3% to $19,995 million during 1975. Total dividends declined for all of the selected mineral manufacturing industries except petroleum and coal products, which increased over 5% to $4,266 million. Total dividends for primary metals declined almost 4% to $1,172 million; for primary iron and steel the decline was over 2% to $717 million; for primary nonferrous metals the decline was 6% to $454 million; for stone, clay, and glass products the decline was almost 2% to $442 million; and for chemicals and allied products the decline was over 1% to $2,758 million.

The total number of industrial and commercial failures and their current liabilities were up significantly in 1975 over what they had been in 1974. The number of failures increased over 15% to 11,432 and their current liabilities were $4.4 billion, which is over 43% greater than the equivalent figure for 1974. The number of failures in the mining sector almost tripled to 26 from the 9 of 1974, although it was not as great as the 32 of 1973. The current liabilities of mining failures at $9.5 million were more than 6% less than those of 1974. In the manufacturing sector the number of failures and their liabilities were both greater than their 1974 equivalents but not by as great a magnitude as the 15% and 43% increases in the total number of failures and their liabilities shown in the preceding text.

New Plant and Equipment.—Expenditures for new plant and equipment increased significantly for mining (including fuels) and for most of the selected mineral manufacturing industries. Expenditures by firms in the mining industry increased over 19% to $3.79 billion; those by all manufacturing firms increased over 4% to $47.95 billion. Expenditures by firms in the primary iron and steel industry showed the largest increase among the selected mineral manufacturing industries; they increased almost 43% to $3.03 billion. Expenditures in the petroleum industry increased over 31% to $10.51 billion, and those in the chemical and allied products industry increased almost 10% to $6.25 billion. Expenditures by firms in two of the selected mineral manufacturing industries declined. Those for the stone, clay, and glass products industry declined over 1% to $1.42 billion, and those for the primary nonferrous metals industry declined more than 2% to $2.28 billion.

Plant and equipment expenditures of

foreign affiliates of U.S. companies increased about 10% in both mining and smelting, and petroleum and declined 3% in manufacturing during 1975. Expenditures in mining and smelting were $1,184 million. Most of this was in Canada, which increased more than 46% over the 1974 value. Mining and smelting investments for plant and equipment declined in all other areas. Petroleum investments totaled $9,370 million. Those in Canada declined over 5%; those in Latin America declined almost 8%; those in Europe increased almost 37%; and those in all other areas, which made up almost one-half of the petroleum investments, increased well over 6%. Manufacturing investments were $11,384 million during 1975. Most of this was invested in Europe, which showed a decline of just over 1%. Investments in Canada declined over 17% and those in Latin America increased almost 17%. Manufacturing investments in all other areas declined over 1%.

Issues of Mining Securities.—Estimated gross proceeds from all corporate primary security offerings in 1975 were $52.6 billion, a 39% increase from those of 1974. Almost 80% of these were from bonds, almost 14% were from common stock, and well over 6% were in preferred stock. Proceeds from offerings in extractive industries increased over 66% to $1.6 billion. More than 53% were from common stock, 42% from bonds, and almost 5% from preferred stock. In the manufacturing sector, proceeds from offerings increased 80% to $18.8 billion. More than 91% were from bonds; 6%, from common stock; and almost 3%, from preferred stock.

Foreign Investment.—Direct foreign investment of U.S. companies abroad increased over 14% to $118.6 billion during 1974 (latest data available). The percentage of petroleum investments received by developing countries remained greater than the percentage of total investments. Investment in developing countries remained at about 24% of total foreign investment, while petroleum investment in developing countries dropped more than 3 percentage points to 27% of total foreign petroleum investment. Petroleum investment in developed countries totaled $18.4 billion. Europe accounted for over 54% of this, and Canada accounted for slightly more than 31%. Petroleum investments in developing countries dropped 2% to $8.2 billion. Of this, countries in the Western Hemisphere accounted for more than 43%; other Africa, slightly over 16%; and the Middle East, almost 20%.

U.S. investments in foreign mining decreased over 18% to $6.1 billion. The largest decrease occurred in Canada, where investment decreased 25%, from $3.7 billion to $2.8 billion. Even with such a drop in investment, Canada accounted for over two-thirds of foreign mining investment in developed countries. Australia ranked second with nearly 24%. Mining investments in developing countries totaled $2.1 billion with almost half going to Latin American Republics.

The value of foreign direct investment in the United States in 1974 (latest data available) was $21.7 billion, an increase of about 19%. Investment in the petroleum sector increased over 27% to $5.9 billion, which was over 27% of the total direct foreign investment in the United States.

TRANSPORTATION

The total quantity of major minerals and mineral energy products transported by rail and water during 1974 (latest data available), decreased by 2.31 million short tons to slightly over 1,720 million short tons. Almost 60% of all commodities transported by rail and over 82% of all commodities transported by water were mineral products. Over 64% of selected metals and minerals, except fuels, were transported by rail, while only about 45% of selected mineral energy resources and related products were transported by rail.

In the metals and minerals, except fuels, category, the volume of commodities transported by rail increased less than 0.1% to 452.3 million short tons. Of this total, over 76% consisted of six commodities: Iron ore and concentrates, crushed and broken stone, iron and steel ingot, sand and gravel, phosphate rock, and iron and steel scrap. The largest percentage decrease was in nonferrous metal scrap, which in 1974 shipped only about 15% of its 1973 tonnage.

Transportation by water for metals and

minerals, except fuels, decreased nearly 3% to 252.4 million short tons. Three commodities accounted for over 76% of the total metals and minerals; they were iron ore and concentrates, crushed and broken stone, and limestone flux and calcareous stone.

A total of 461.6 million short tons of mineral energy resources and related products were transported by rail in 1974; this was 4% greater than that of 1973. By volume the largest commodity shipped was bituminous coal and lignite, which accounted for nearly 84% of the total. Crude petroleum shipped by rail increased nearly 38% from that of 1973.

Water transportation of mineral energy products totaled 554.6 million short tons in 1974, more than 2% below that of 1973. Again, coal accounted for the largest share of tonnage, 26%; followed by residual fuel oil, 20%; gasoline, 16%; and crude petroleum and distillate fuel, each 15%. The largest percentage increase occurred in coke, almost 31%. Significant decreases occurred in jet fuel, 18% and liquefied petroleum gases and coal gases, almost 27%.

A total of 976,700 miles of gas pipeline existed in 1974 (latest data available), an increase of more than 1% from that of 1973. Total petroleum pipeline mileage in 1974 (latest data available), as reported before, was 222,000 miles. It was made up of 31% crude gathering systems in field operations, 34% large size crude trunklines, and 35% petroleum product pipelines extending from refineries to extraction terminals.

RESEARCH ACTIVITIES

Total research and development expenditures in the United States during 1974 (latest data available) were $22.3 billion, almost 7% greater than that in 1973. Following past patterns, almost 63% was spent by the private sector and more than 37% was spent by the Federal Government. Research and development expenditures in the petroleum refining and extractive industries increased almost 19% to $598 million. Almost 97% of these expenditures were privately financed, with the remainder financed by the Federal Government. Expenditures in the chemicals and allied products industries increased more than 13% to $2.4 billion. Almost 91% of these were financed by private industry. During 1973 the percentage of research expenditures financed by private industry was about the same as that of 1974.

Bureau of Mines.—The role of Bureau of Mines research is to foster the efficient use of our mineral resources in order to insure adequate mineral supplies without objectionable environmental, social and economic effects. The Bureau conducts scientific and engineering investigations to improve the recovery of minerals from domestic deposits, to improve the economics of recycling scrap metals, to achieve more efficient utilization of mineral products by extending their lifespan, and to find industrial uses for mineral wastes and thus improve the environment. Bureau research concentrated on the following areas: Mining, metallurgy, secondary resource recovery and pollution abatement, economics and helium.

Bureau of Mines funding obligations for mining and mineral research and development during fiscal year 1975 were $101.6 million. This figure is almost 54% greater than the corresponding 1974 figure. Funds for applied research in fiscal year 1975, at $51.0 million, were more than double those for fiscal year 1974. Funds for basic research declined almost 66% to $1.9 million. Funds for development increased almost 37% to $48.7 million. For fiscal year 1976, obligations were estimated to be $139.0 million, an increase of almost 37%. Funds for applied research in fiscal year 1976 were estimated to increase almost 55% to $79.0 million; for basic research they were estimated to decline almost 53% to $0.9 million; and for development they were expected to increase over 21% to $59.1 million.

Bureau of Mines funding obligations for total research increased more than 73% to $52.9 million during fiscal year 1975. Funds for engineering sciences nearly doubled to $47.7 million; for the physical sciences they declined over 64% to $1.9 million; for the mathematical sciences they increased more than 169% to $1.3 million; and for the environmental sciences they increased almost 143% to $2.0 million. Obligations for total research for fiscal year

1976 were estimated to increase 51% to $79.9 million. For engineering sciences they were estimated to increase almost 55% to $73.9 million; for the physical sciences they were estimated to increase almost 10% to $2.1 million; for the mathematical sciences they were estimated to increase 23% to $1.6 million; and for the environmental sciences they were estimated to increase 17% to $2.4 million. Highlights of Bureau research activities, including work in progress, follow.

Mining.—The full-scale demonstration of shortwall mining in Kentucky continued during 1975. The second, third, and fourth panels were extracted, and development was completed on the fifth and sixth panels. Productivity averaged 583 tons of coal per shift in the fourth panel giving an average of 47 tons per manshift, an increase of 2 tons per manshift over panel three. Production of this shortwall continued to increase with each successive panel. Overall recovery was 85% and productivity by shortwalling was 28% higher than by room-and-pillar methods. Methane control has been simplified, health and safety of the miners increased, and respirable dust concentration at the face averaged only 0.26 milligrams per cubic meter. The shortwall system demonstration has been resulting in high employee morale and acceptance by industry.

The study of single-entry development for longwall mining, which includes measurement of forward and backward abutment pressures, closure and determination of rock properties in the 17th left longwall panel continued. Stiff supports, fiber-reinforced concrete cribs, were installed in a test section to determine if a stiffer support will create a cave line. A three-dimensional structural analysis and field evaluations verified the results that wood cribs do not have the required stability. Advance rates have increased as the result of new configurations, support, and divider systems. The single-entry system illustrated that reduced development time and increased coal recovery are achievable goals, thereby reducing extraction costs.

Work on testing the feasibility of using inorganic materials for grouting roof bolts of steel and other materials was initiated. Lab tests on grout formulations illustrated that a standard ⅝-inch bolt can be pull-tested to a value exceeding its yield strength within 5 to 7 minutes of grouting. Costs of inorganic grout materials are less than current resins used with full column bolts; therefore, the successful demonstration of these grouts will allow industry to reduce support costs.

Development of instrumentation techniques and procedures to determine resin bolt strength parameters was completed. Laboratory tests of instrumentation and two full-scale field test programs have resulted in a complete monitoring program for full column resin bolt sections.

Coal mine bumps and outburst phenomena are being investigated by means of microseismic techniques to identify the release of strain energies prior to the event. This allows for initiation of preventative measures and a lengthening of warning time, thereby increasing the safety conditions in working areas. Several outbursts have been recorded and the resulting data are being processed to identify the prediction signatures that are associated with these phenomena. Coal mine bumps were related to mining activity in a longwall mine whereby microseismic activity correlates with mining cycles and normal levels of microseismic activity can be established therefore providing evidence that bounce locations can be established.

Monitoring of pit wall stability at an open pit mine in Nevada by a microseismic system resulted in identifying a failure zone prior to actual failure. A comprehensive report detailing the method of detection was provided to the mining industry, which now has available a reliable and accurate means of detecting progressive failure in an open pit slope.

Shallow seismic and acoustic reflection techniques were evaluated by means of field tests at working mines to detect channel sands in advance of mining. The value of integrated geophysics using results from remote sensing, seismic resistivity, and magnetics was demonstrated.

An automatic roof failure warning system was installed in a Colorado mine. The collection of microseismic data in the presence of mine machinery noise was successfully demonstrated. System modifications were completed to allow it to work in areas where electric blasting caps were used. The refined system will provide a fully automatic means of providing prior warning to miners of impending failures and thus result in a reduction of injuries from the primary mining hazard, roof falls.

A 1,350-cubic-foot chamber at the Bureau's Pittsburgh Mining and Safety Research Center has been adapted to measure toxic fumes from explosives under conditions simulating those encountered in underground mines. A gelatin dynamite and two water gel blasting agents were fired in the Crawshaw-Jones testing apparatus that simulates restricted expansion after explosion, and also in the 1,350-cubic-foot chamber, to investigate the presence of ammonia in fumes from explosives. Both free and combined ammonia were found. The large chamber values for all three explosives were two to four orders of magnitude higher than the Crawshaw-Jones values. In both tests the water gels produced 3 to 10 times more free ammonia and 2 to 3 times more combined ammonia than the gelatin dynamite.

A personal dosimeter for nitrogen dioxide was developed by the New York University Medical Center as part of a comprehensive Bureau of Mines grant covering passive devices that monitor exposure to CO, NO, and NO_2 in the range near and below the threshold limit value or ceiling limit. The dosimeter is encased in a plastic tube 2½ inches long and clips to a worker's hardhat.

A comprehensive array of detectors and warning systems was being developed to monitor underground atmospheres for hazardous levels of combustion products or potentially explosive substances. The flammability and optical transmission properties of coal dust clouds were being studied; the objective was to develop a monitor that warns when dangerous concentrations of coal dust are in the air. Miniature probes that measure dust cloud concentrations in explosive environments have been developed and found to operate satisfactorily at the Bruceton experimental mine. An infrared device initially developed for detecting methane air ignitions (U.S. Patent 3,859,520) was being incorporated into a general fire detector. Commercial sensors of combustion products were being evaluated and new optical sensors developed. In-Ga-As diodes have been developed that produce radiation at the absorptive band of methane (3.2 microns). These diodes will be used in conjunction with photosensitive diodes having maximum sensitivity at the same wavelength in the construction of an advanced and inherently more reliable methanometer. A dual-band infrared technique has shown great promise for detecting overheated rollers on conveyor belts. Laboratory tests indicate the system can rapidly and reliably detect temperature rises as small as 25° C above ambient.

A lightweight telescopic probe has been developed through which a gas sample from the working face can be pumped into a methanometer located safely under a permanently supported roof. Weighing about 7 pounds, the probe is almost 19 feet long when fully extended. Closed, it is approximately 5½ feet long. Flexible tubing can connect the telescopic probe outlet to either a self-pumping or a diffusion methanometer. An operator can both support the probe and actuate the pump with one hand, leaving the other free to operate the methanometer controls.

In a counterpart research project, a three-port sampling system was developed for installation on a continuous miner, the objective being equipment that provides the operator with measurement of methane gas emissions from various locations on the working face during the coal cutting operation.

In cooperation with a coal company in West Virginia, a low-cost automatic fire protection system was designed and installed on a Compton surface coal auger for a 6-month test period. The system protects engine areas using six thermal sensors and two 30-pound cylinders of ABC-type dry chemical extinguishant. Two manual override switches can also activate the system. The system has been successfully test-fired twice, and the company plans to purchase several upon completion of the test program. An associated project was developing prototype hardware for a load-haul-dump vehicle. Design alternatives available for better protection of mobile underground diesel equipment were developed.

Research into the ignition of methane-air mixtures by sparks from the frictional impact of aluminum alloys on rusted steel at typical coal mine fan speeds was undertaken. Experiments demonstrated that this combination of materials is highly incendive under simulated fan conditions and that some substitute materials might minimize the ignition hazard. This information has been communicated to the Mining Enforcement and Safety Administration (MESA), which is considering draft standards for preventing ignitions from this source.

A mine machinery trainer was being developed as a device for teaching shuttle car operator skills. Component testing of powered and unpowered dynamic models was completed and a motion platform and hazard generator were in the final phase of development.

Information from several past projects provided a basis for applying human engineering principles toward correcting the shortcomings of current operator compartments. This work will provide design and installation guidance to equipment manufacturers and coal mine operators. Design drawings of the operator compartments of 89 machine models for seven major machine types have been modified to optimize the position and location of various controls. This series of drawings illustrates study concepts and recommendations and should be used as guidelines by rebuild shops; they are not engineering drawings that can be immediately used by a manufacturer. This intermediate step was necessary to compensate for specific machine differences. Six machines were being modified by the Bureau using the optimized operator compartment drawings as guidance. It appeared that the concepts can be adapted with few modifications to new machines to be built by manufacturers.

A prototype time domain reflectometer (TDR) that detects faults in trailing cables had been successfully tested, and the Bureau was constructing field test models. Design modifications were in progress to achieve the higher sensitivity and increased range of application needed to locate all faults on a cable from a single setup.

Poor quality grounding creates a safety hazard. Recent difficulties with measuring ground bed resistances indicated a need for simplified and comprehensive instructions on the best techniques available. Step-by-step procedures have been produced that will allow mine electrical personnel, with little or no experience, to build and maintain effective ground beds. A laboratory prototype protective device for detecting low-current trolley line to ground faults in the presence of high current loading was designed and demonstrated for mine haulage systems. The detection system can respond to fault currents that are 0.5% of normal full load current.

The Bureau developed a commercially available fluorescent cap lamp that provides improved light distribution and supplies mine personnel with peripheral vision. This cap lamp is suitable for tasks that do not require long-range spot illumination, providing illumination above the minimum level (0.06 footlambert) at 5 feet over an area 8 to 10 feet wide. It is rechargeable and provides 10 hours of continuous operation per charge.

A fluorescent lighting system for low coal that includes portable area as well as machine-mounted lights was developed and installed on an auger miner. It successfully illuminated working areas to proposed standards for several months and is highly acceptable to operating personnel and management. A lighting system for longwall operations was developed on-site in an existing longwall section in an operating mine, and evaluation results were used to produce an improved illumination system.

A miniaturized monitoring and telemetry system was developed that monitors methane, ventilation, carbon monoxide, and temperature levels within a mine and computes the rate of temperature rise. The monitoring station is housed underground in an enclosure approximately the size of a loudspeaking telephone. Monitored results are displayed underground and telemetered to a small surface console as well. The system was installed and is being tested in a mine. An advanced underground monitoring and communication system was designed and fabricated for testing in a mine. The system monitors face, section, and haulageway air, provides through-the-earth emergency communications at key locations in the mine escapeway, electromagnetically detects and locates trapped miners, incorporates a computer-controlled coaxial cable telephone and monitoring capacity of 200 communication channels, and has alternate communication paths through mine power cables surfacing through boreholes and wireless overland radio for surface transmission. About 80% of the equipment had been installed.

Ten-minute and 1-hour oxygen breathing systems have been developed and approved for use in underground mines. Efforts during the year were directed at seeking higher density oxygen sources that will enable reduction in the size and weight of the 1-hour device.

During 1975 two improved communications systems for rescue teams were developed. One employs a versatile, lightweight radio (walkie-talkie) that uses a detached small-diameter wire between the radios as a wave guide. The other system consists of a hands-free microphone and ear speaker mounted on the rescue helmet. A relatively lightweight wire connects the fresh air base with rescue team units. A miniaturized signal generator powered by a miner's cap lamp battery was developed for the belt-mounted electromagnetic miner location system. The unit, approximately 1.3 by 3.5 by 0.3 inches, or one-tenth the previous size, will be packaged for mounting on a miner's belt. The waveform generator was being modified to receive voice communications from the surface and to transmit "yes" or "no" type coded signals.

A handheld infrared viewer operating in the 3- to 5-micron range was fabricated and evaluated at the Bureau's Experimental Mine. Clear images of men were obtained through dense coal smoke over a distance of 250 feet, showing excellent potential for locating miners trapped in smoke-filled entries. This technology will be applied to development of a borehole probe smoke viewer for rescue teams using solid-state infrared viewers.

A 10-pound ice-based prototype cooling vest, compatible with rescue worker backpack breathing apparatus, was designed and fabricated. Laboratory tests in a hot environment indicated that the cooling vest significantly reduces heat stress experienced by rescue team workers.

The principal effort to control noise was directed at reducing it at its source. A lightweight, inexpensive, add-on system of integral muffler-enclosure for a 75-pound class stoper drill received widespread acceptance by drill operators and appeared to suffer few maintenance problems while reducing the noise level from about 115 decibels on the A scale (dbA) to 100 dbA. An assessment of noise control of underground diesel-powered mining equipment in metal and nonmetal mines identified the significant noise sources, determined the feasibility of reducing the noise levels, and evaluated control techniques for possible application. In a demonstration project for one class of machine, the noise level at the operator's position of a Getman dispatch vehicle was reduced from 101 dbA to 87 dbA.

The preliminary design of a mechanical method for handling supplies and materials in underground coal mines to minimize manual handling and related accidents was completed. The system includes special containers and pallets for supplies and materials, mine cars for transporting these packages, and self-propelled equipment for unloading and transporting the packages to the point of use. A feasibility study of an automated rail haulage system for underground coal mines was completed. The study concluded that automation of rail haulage systems was technically and economically feasible. It also indicated a 50% reduction in fatalities and a 50% reduction in injuries due to rail haulage if the rail haulage portion of underground bituminous mines was automated. Based on fatality and injury data for the years from 1968 to 1973, inclusive, these reductions would annually eliminate an average of 9 fatalities and 400 injuries attributable to rail haulage.

Construction was completed and underground tests initiated on a new conventional mining system. The system consists of four closely integrated pieces of equipment. The coal is cut by a unique fullface, twin auger machine that offers a unique sump-cycle capable of 16 feet of penetration while the operator is always under supported roof. Coal is transported away from the face by a specialized load-haul-dump unit that offers speed, ease of operation, and a design that stresses safety. Coal is discharged at the belt line by a special belt feeder that can easily handle the large car load and can disperse the load at any desired rate. The roof is supported either by a new roof truss system utilizing wire rope or by conventional roof bolts installed by a Roofroper. The four machines together form a complete, safe, and economical system.

A study to determine the state-of-the-art of underground hydraulic mining systems throughout the world was completed. This study cataloged all available data on these systems, identified the application of these systems to U.S. coal deposits, and recommended future hydraulic mining research. The results of this study will be useful in developing a mining system that both mines and transports the coal hydraulically.

In the area of in-mine entry development, boring operations commenced at a mine where a Bureau modified tunnel boring machine will ultimately drive a 6,000-foot-long, 18-foot-diameter entry to open up a virgin area of the Pittsburgh coal seam for longwall panel development. Boring operations indicated that excavation rates of 100 feet per day can be achieved once all support systems designed for the project are incorporated. An in-seam miner developed outside the Bureau completed initial in-mine equipment trials, demonstrating tremendous potential as a rapid in-seam entry driving unit. In preparation for a subsequent demonstration, a number of improvements in design were incorporated on the machine, and action was initiated to obtain support equipment to expedite advance rates.

In the area of shaft construction, development was initiated on a blind shaft borer capable of mechanically excavating 24-foot-diameter shafts and placing lining at rates far in excess of conventional methods. Conservative estimates of the system's performance are the construction of 25 feet of lined shaft per day—a representative average figure for conventionally sunk shafts is approximately 45 feet per month. A system for remote placement of shotcrete lining in raised bored shafts was developed. Placement rates of 30 feet per hour are anticipated without the need for men in the shaft. Work was completed on the fabrication and shop-testing of a conical boring device expected to have the capability of rapid excavation of 42-inch-diameter blind shafts without the aid of thrust applied by a drill rig. To test the results obtained in Europe against U.S. conditions, the Bureau purchased a set of shield-type supports and entered into an agreement for trials to be conducted at a mine in New Mexico.

Shield-type supports had been purchased and were to be installed on a longwall face at a mine in southern Illinois where six previous attempts to longwall had failed. Results in Europe with this type of support indicate that it can successfully operate in conditions adverse to chock-type support operation.

The Bureau contracted with the National Aeronautics and Space Administration (NASA) to conduct research into longwall shearer guidance and control problems and to make recommendations regarding the development of equipment that will allow remote control and eventual automation of the machine cutting and loading functions. The first task which NASA was to embark upon was an examination of all or any means for remotely detecting the coal rock interface. This is a problem that to date has not been successfully solved eleswhere in the world where research and development has been attempted.

The Bureau has embarked upon a program to collect data on the behavior of strata associated with longwall working so that more accurate support design parameters may be defined.

A state-of-the-art review on remote control for continuous miners was completed that documented the opinions and judgement of experienced senior coal mining people on automated remote control continuous mining machines.

Industrial engineering studies on conventional and continuous mining sections passed their respective contract midpoints. Preliminary results indicated mines with a definite mining plan have better productivity. This preliminary result initiated two competitive procurement projects for fiscal year 1976 that will deal with improved techniques for supervisory management and maintenance management.

The design and fabrication of a shortwall face haulage system for transporting coal continuously from a continuous miner to a panel belt was completed. The system consists of a 150-foot-long face chain conveyor and a 200-foot-long monorail-mounted transfer belt conveyor. The inby end of the transfer conveyor is equipped with a self-propelled crawler-mounted tail drive section that will be used to move the transfer conveyor as the shortwall is retreated and to drive the belt conveyor. The system was to be demonstrated in an underground mine and was expected to increase shortwall production and productivity significantly by replacing the currently used intermittent shuttle car haulage method.

An industrial engineering study of coal

haulage in room-and-pillar mines was completed. Among the recommendations made to improve production, productivity, and cost were proper selection of shuttle car routes, better timing of panel belt moves, development of shuttle cars with higher payload to overall vehicle volume ratios, development of continuous haulage equipment with the capability of negotiating right-angle turns and eliminating spillage, development of alternative power sources for shuttle cars to eliminate trailing cables, and improvement of the equipment and methods for advancing and retreating the panel belt tail section.

The goal of increasing production through utilization of a more nearly continuous mining cycle was pursued through design and development work on miner-bolter systems. One concept incorporates both the miner and four automated bolter modules on one machine. The other uses a conventional miner followed by a bolter module that also transfers the coal to a following conveyor system.

In addition, design work continued on an automated bolter module. This unit has the potential of being mounted on a conventional drilling machine. Final design and component manufacture of the flexible drill concept (the ability to drill longer-than-seam-height roof bolt holes) was carried out by five contractors. These systems should reduce roof bolting time and increase mine safety.

A major cost-sharing contract was awarded for design, development, and demonstration of a top slicing method utilizing longwall techniques for recovery of thick seam coal. If the design and feasibility studies are favorable, the system will be demonstrated at a mine in Utah. A request for letter proposals was issued for underground mining concepts applicable to thick and multiple seam western coal deposits. The most promising of these concepts will be candidates for further development and possible demonstration. A study of the spontaneous combustion problem associated with western underground coal mining was also initiated.

Development of a fourth foam dispenser and an inert gas generator system to extinguish mine fires was nearing completion. A working model of the foam dispenser was undergoing refinement to eliminate the possibility of feedline corrosion induced by heat from the foam formula. The gas generator unit was under fabrication and field demonstration of the complete system was planned.

The advancement of subsidence engineering technology to alleviate surface damage in undermined areas continued to gain momentum in 1975. Prototype instrumentation was devised to monitor ground movement, and this equipment was utilized to study the mechanics of overburden adjustment over both longwall and room-and-pillar coal mines.

In addition, the Bureau demonstrated more expeditious methods of premining exploration to reduce the cost of developing detailed subsurface information needed for effective subsidence control. Geophysical instrumentation was miniaturized to permit the measurement of numerous geologic characteristics with a single downhole probe. The multipurpose probe can be used in small-diameter borings. Data collection was further expedited by a computerized read-out system that facilitates rapid interpretation of the geologic logs. A working model of this unit was fabricated in 1975 and demonstration is underway.

The subsidence control research effort was further expanded in 1975 by a search for inexpensive backfill material with cementitious properties. Attention was directed toward various mixtures of mine refuse, fly ash, and other industrial wastes.

Two field tests demonstrated the successful use of long horizontal holes from the bottom of a shaft to degasify the Pittsburgh coalbed ahead of mining and simultaneously make the methane available as a source of energy. At one shaft, 728 million cubic feet of pipeline-quality gas had been removed after 1,150 days of degasification; at the other shaft 686 million cubic feet had been produced after 818 days.

A simple dust method test was developed for determining the gas content of a coal core sample.

Two major advanced mining systems are under construction. The first, a prototype borehole mining system, will use a water jet to break the coal and a slurry pump to lift the broken coal to the surface. The second, an underground auger panel extraction system, consists of an underground augering machine, coal conveyors, and auxiliary ventilation and rock dusting equipment, and will be used to mine out prepared panels of coal at low cost and high recovery rates, and to "second mine" or "rob" pillars in seams that have been mined by room-and-pillar methods.

A small-scale economic and engineering evaluation of underspoil haulage of coal out of strip pits was completed. The study showed significant benefits for using a conveyor inside a culvert buried in the advancing spoil pile for coal haulage if used in thick seams typical of western surface mines. Substantial studies and laboratory experimentation were also conducted in preparation for development of both high-volume, low-pressure and low-volume, high-pressure water jet mining systems. A number of small studies were also undertaken of various new mining system concepts that may eventually result in full-scale development.

A wire rope fatigue testing machine was being constructed as part of a project to extend the service life of ropes used in large draglines. The machine will exert loads of a half million pounds while cycling the ropes through 20 feet of stroke around 90-inch-diameter sheaves, and its 3-inch-diameter rope capability exceeds that of any other such machine known. Along with improvements to existing equipment such as this, new equipment concepts were also being explored. One new concept was a 15-foot-tall vertical blade that is pulled along the coal or overburden face by two tractor dozers. The coal overburden that is sliced off falls onto a conveyor that can load either trucks or other conveyors.

A family of new reclamation tools that will enable operators to level spoil banks faster and at lower cost was being tested. The tools included a 40-foot fixed angle blade, a 24-foot V-plow, a 24-foot grading bar, a 28-foot angle blade utilizing side-by-side crawler tractors, and a 60-foot angle blade with variable angle capabilities. The purpose of the blades is to move spoil material a short distance laterally to the outslope of the spoil banks. Field tests proved the 40-foot blade to be more efficient for moving up to 80% of this material than conventional dozing.

Design was initiated of a surface test facility for testing underground mining equipment under simulated conditions above ground. This facility will help speed the development and introduction of improved technology and will be used to thoroughly test and evaluate new equipment, systems, and procedures prior to their use underground. The facility will be located at the Bureau's Bruceton, Pa., Mining and Safety Research Center, which is convenient to the majority of mining equipment manufacturers. It will have four major components, all of which will be available to industry on a cost reimbursement basis: Equipment trials area, roof support research facility, hydraulic transport research and development facility, and coal preparation laboratory and test plant.

Research to develop more productive and environmentally acceptable surface coal mining, extraction, and reclamation systems, initiated in 1974, continued. Studies included assessments of the impact of surface coal mining operations on the environment; development of new surface coal mining concepts to include a terrace pit system, area-longwall mining, and a conveyor overburden haulage system for use in haulback contour mining operations; design of improved overburden handling and spoil segregation techniques; and development of improved reclamation methodologies to facilitate long-term, stable reclamation of mined areas.

In-house research studies on the utilization of fly ash as a spoil amendment and an analysis of the effects of ground vibrations from blasting activities on structural fatigue were conducted. Blasts were monitored at structures located near active coal surface mining operations to determine the associated ground vibration levels and assess any resultant structural damage. Data collected will be used to develop the relationship between ground vibration levels and structural damage. Fly ash studies demonstrated the value of using fly ash as a spoil amendment to neutralize acidic mine spoil and facilitate revegetation.

An exploratory drilling program was initiated in the Piceance Creek Basin of Northwestern Colorado. The objective is to core the deep rich oil shale zones below the Mahogany Zone. Some of these oil shale horizons lie as deep as 2,500 feet and attain thicknesses of 400 to 500 feet.

Extensive waste management studies investigating spent shale were initiated. The physical and chemical properties of retorted shale have been evaluated in the laboratory and numerous before-and-after compaction gradation tests, compaction, and in-place density tests were determined in the field.

The first comprehensive baseline studies on potential surface, underground, and modified in situ mining processes have identified several mining systems, detailed mining plans, and their respective economics. Reliable information to government and industry on which to base sound management decisions relating to oil shale mining and waste disposal was thus provided.

Recent field tests in two deep vein mines showed that slimes in unclassified tailings can be retained and consolidated in primary stopes using electrokinetic methods. Such retention increases the available backfill and eliminates the problem of slime removal. Safety, economy, and efficiency of the method were demonstrated. As a direct result of the Bureau's demonstrations, the mining company has adopted electrokinetic consolidation as a part of normal underground mining practices in these two mines.

An exhaustive review of the underground systems used to handle men, materials, and supplies was completed. The problem areas associated with the systems were defined both from the safety hazard and production delay standpoints. Two areas presenting the greatest problems were found to be the vertical handling systems underground and the unnecessary movement of men and materials. The study recommends corrective measures for both as well as research goals for the future.

Structural analysis capabilities have been extended to the prediction of the behavior of a mine structure composed of rock strata whose elastic and strength properties are randomly distributed. Predictions of mine structure response can be made on a probabilistic basis, taking the scatter usually encountered in measured rock properties into account, rather than ignoring it as is done in conventional analysis.

A study of the assessment of damage from repeated blast-induced ground vibrations produced evidence of fatigue damage to structures from repeated vibrations at levels that were too low to produce damage from single occurrences.

Experiments with aluminum-sensitized water gels, using aluminum treated with Teflon to render it dustless (Harshaw Process), showed that the special grades of aluminum required for explosive sensitization can be treated in this way without any appreciable loss of effectiveness as sensitizers. This could reduce or eliminate the explosion hazard associated with the use of aluminum in the manufacture of explosives.

Techniques developed to identify explosives after detonation appear applicable to two problems: The identification of clandestine use of explosives and the control of the use of nonpermissible explosives in gassy mines. The experimental phase of the program was successfully completed with a full-scale field experiment in a mine in which commercially seeded explosives were used in production blasting for a period of several weeks. Individual batches of permissible and nonpermissible explosives were readily identified and distinguished following the blasting operation.

Metallurgy.—The general objective of the Metallurgy program is to provide, through research and development, the scientific and technical information necessary to encourage and stimulate the nonfuel minerals industry to make the expeditious advances in technology that will encourage the industry to produce an adequate supply of mineral raw materials at acceptable material and energy costs, and with a minimum of waste and environmental degradation.

The Bureau's miniplant for testing and evaluating processes for the recovery of alumina from domestic nonbauxitic resources continued operation at Boulder City, Nev. This cooperative project, with the support and advice of the alumina consuming industry, considered six potential processes. These included nitric acid, hydrochloric acid, and sulfurous acid processes for the extraction of alumina from clay and processes for treating anorthosite, alunite, and dawsonite. Operation of the nitric acid miniplant had been completed and the plant placed on standby. Installation of the hydrochloric acid miniplant was nearly complete. Additional installations were planned for the remaining processes.

Studies continued on methods of concentrating domestic nonmagnetic iron resources. Certain nonmagnetic taconites from the Marquette range and the Western Mesabi were successfully treated using a selective flocculation-cationic collector flotation process. The prospects of additional applications of this process, following the pattern of the Tilden, Mich. plant, appeared promising. In related work, a procedure was developed for reducing the silica content of magnetic iron ore concentrate by the use of flotation. The process developed by the Bureau produces concentrates suitable for making prereduced iron pellets that may be used in electric furnace operation.

Dump leaching was becoming increasingly important as a source of copper. Bureau of Mines personnel developed an improved method of constructing dumps for leaching. They discovered that, for most ores tested, the copper content of the fine-sized portion is appreciably higher than that of the coarse ore. Consequently, it was found that preliminary coarse crushing and screening out of the fine material, before forming the dump, permits it to be leached more efficiently and rapidly. The fines separated are sent to the flotation mill for recovery of the copper; byproduct metals that would not be recovered by leaching are also recovered by the flotation method. Evaluations indicated that for many ores the extra cost of crushing, screening, and handling may be more than compensated by increased metal recovery.

With the depletion of sulfide ores, laterite oxide deposits have been increasingly utilized as a source of nickel. Singmaster and Breyer, under a Bureau of Mines contract, completed phase I of a study to determine the technical and economic feasibility of the Bureau's extraction process utilizing low-grade domestic western laterite ores. The study, based on a 5,000-ton-per-day commercial-scale plant for extracting nickel, cobalt, and copper, found that the process is technically feasible and that, depending upon financing structure, the process could provide a modest return on equity. The open file report (OFR 65–76) is available for inspection at the Bureau's Metallurgy Research Centers and is available from the National Technical Information Service (PB 256 574/AS).

In cooperation with the Florida State Bureau of Geology, the Bureau of Mines performed characterization studies of the phosphate-bearing Hawthorn Formation that underlies the phosphate land pebble region of Florida. The formation is estimated to contain 2 to 4 billion tons of P_2O_5 at a concentration of 5%, which is lower than the average of 14.7% P_2O_5 that has been mined domestically. The Hawthorn Formation has not been mined because of the lack of a suitable beneficiation procedure. However, the Bureau of Mines has been able to obtain concentrates containing up to 31.8% P_2O_5 by a fatty acid flotation process. The results indicate that this vast phosphate resource will be usable as a raw material source for phosphate fertilizer when present reserves are exhausted.

The Bureau of Mines assisted the Energy Research and Development Administration (ERDA) by developing improved materials for use in ERDA's Synthane plant, which converts coal to high-Btu gas. Materials have been prepared and tested for use as valve seats, ceramic liners, and Raney nickel catalyst structures. The abrasive nature of coal and char has resulted in very short lives for valves used in coal gasification equipment. The Bureau demonstrated the successful coating of 10-inch valve seats by chemical vapor deposition of tungsten, but successful valve seat-wear performance in ERDA test facilities was achieved with homogeneous materials such as modified Stellite No. 6 and a high-chromium iron in 10-inch and smaller valves of alternate design. A catalytic conversion step is used to upgrade the low-Btu gas produced in most coal gasification processes into high-Btu, pipeline-quality fuel. The catalyst, known as Raney nickel, is derived from a brittle aluminum-nickel alloy which has had to be applied to the reactor surfaces by the slow process of flame spraying. The Bureau of Mines developed a procedure for preparing shaped Raney nickel castings that may be inserted directly into tubular reactors. The castings have significantly longer life than the sprayed catalyst.

A critical compilation, "Thermodynamic Properties of Nickel and Its Inorganic Compounds," (BuMines Bulletin 668) was published. The bulletin contains information on basic thermodynamics for metallurgical reactions over extended ranges of temperature. It is organized in both tabular and equation form for ease of use and contains a cross-referenced formula index and a bibliography. The Bureau of Mines published Information Circular 8700 "Uranium From the Chattanooga Shale," which assesses the problems involved in mining the Gassaway Member in a 12-county area of Tennessee. The report estimates uranium resources to be 4.2 to 5.1 million tons contained in 76 to 91 billion tons of shale. Mining, costs, and land disturbance problems are discussed.

Work to produce a more nearly anhydrous magnesium chloride from $MgCl_2 \cdot 6H_2O$ without the formation of magnesium oxide continued. Procedures for the decomposition of organic amine hydrochloride, which may be obtained in the anhydrous state more readily, were improved to obtain a $MgCl_2$ product containing 0.32% oxygen and 0.66% amine hydrochloride. The Bureau continued its cooperative program of testing clay specimens submitted by State geologists in cooperating States. In the last 5 years nearly 3,000 samples from 31 States have been processed. The testing program identifies sources of raw materials for products used by local construction industries.

Bureau studies were underway to determine the most economical method of extracting manganese from deep sea nodules. Research turned to the recovery of manganese as well as cobalt, nickel, and copper, because of the role of manganese as a strategic metal.

Secondary Resource Recovery and Pollution Abatement.—The Bureau of Mines process for recovering values from municipal raw refuse was adopted by Baltimore County, Md., Montgomery County, Md., and Monroe County (Rochester), N.Y. The process recovers ferrous and nonferrous metals, glass, and a combustible fraction. The 400-ton-per-day Baltimore County raw refuse plant was under construction and was to begin operation in 1976. The plants in Montgomery and Monroe Counties were in the design phase and were expected to open in 1977 and 1978, respectively. In addition, the Spanish Government built a pilot plant based on the Bureau's raw refuse technology and planned to build two full-size facilities. Other cities, including Tampa and St. Petersburg, Fla., were working with the Bureau to determine the feasibility of adopting this process.

Technology developed by the Bureau of Mines for incinerating junk cars without producing smoke was being used commercially by over two dozen companies across the country. The low-cost smokeless incinerating system, which was designed by the Bureau's Salt Lake City Metallurgy Research Center, features a large garage-like burner equipped with an afterburner chamber, which heats combustion gases to more than 1,350° F, and a tall stack. Once burned, the junk cars can be dismantled for their metal values and the scrap sorted, baled, and bundled for sale and reuse.

Mixtures of ferrous scrap reclaimed from municipal refuse and shredded auto scrap were successfully melted in the Bureau's basic-lined cupola to produce gray iron. The scrap was obtained as a magnetic fraction from a municipal refuse reduction plant. Satisfactory castings can be obtained with up to 75% refuse scrap using a 5.5/1 scrap/coke ratio. The castings made with 75% refuse scrap were low in carbon, but this difficulty may be overcome by charging with additional coke. Tramp elements in the castings were not objectionably high with furnace charges containing up to 90% refuse scrap.

Sulfur, which could become more abundant as stack gas desulfurization becomes more widespread, was studied by the Bureau for use in paving and construction materials. Methods have been developed for preparing, placing, and evaluating sulfur-sand-asphalt mixtures. Sulfur may replace up to 52 weight-percent of the asphalt. The addition of sulfur produces a paving that is considerably more resistant to attack by petroleum fuels. Test sections were placed on public streets and highways and were being evaluated in cooperation with the municipality of Boulder City, Nev.

A process development unit was assembled to demonstrate the recovery of chromium and other values from waste solutions such as those obtained during the etching of copper-printed circuit boards and brass mill products. The first step in processing such wastes is the reduction of hexavalent chromium to the trivalent state, normally a costly chemical process. In the process development unit this is accomplished, at a considerable saving, by the use of waste paper. The unit then further processes this solution to recover zinc, chromium, and copper. The Bureau-developed waste-plus-waste process was adopted by a Kansas City, Mo., firm. In this process, alkaline cyanide electroplating wastes are neutralized with acid waste solutions such as pickle liquors to precipitate metal cyanide and hydroxides. The solutions obtained have low residual cyanide and metals. The precipitate may be treated pyrometallurgically to recover its metal values.

As a part of the Bureau of Mines research on tailings stabilization, vegetation having a high tolerance for metal salts continued to be sought. Several species of grasses, brought to the United States from Africa, recently were grown in the laboratory on untreated tailings. The grasses appear to be ideal for tailings stabilization work. To take advantage of the desirable qualities of these grasses while avoiding possible undesirable effects, attempts will be made to cross the African grasses with American species to obtain metal-salt-resistant grasses having other desirable properties.

Extended life for American phosphate deposits and reduced slime pollution problems were the goals of the Bureau's new direct sulfuric acid digestion process. The process produces waste suitable for reclaiming mined-out areas rather than the slime generated in conventional processing, and yields up to half again as much phosphoric acid from a given amount of ore. Except for its alumina content, the phosphoric acid is comparable to the acid used for the manufacture of fertilizers. Bureau research was continuing to reduce the aluminum content. Work by the State of Florida aimed at determining whether there is a connection between reclaimed phosphate mining lands, and radiation readings reported by the U.S. Environmental Protection Agency (EPA) was supported by the Bureau of Mines. Under the grant, the Florida State Bureau of Geology will inventory some 10,000 acres of mined phosphate lands in central Florida by age, mineralogy, type of mining, and related factors including type of reclamation. The State Bureau will attempt to relate the categories to preliminary radiologic data reported by EPA in September 1975. Soil samples will be collected and analyzed by the Bureau from each category of mined land. The data will aid in establishing which lands are likely to show elevated radiation levels and will also help in developing new reclamation techniques, if necessary, for minimizing radiation exposure.

Economic Analysis.—The Bureau of Mines economic research program continued the study of economic conditions affecting the mineral industries and, in turn, the effect of the mineral sector on the national and international economies. The purpose of this research was to provide decisionmakers with accurate, up-to-date information and analyses useful in reaching conclusions. The economic analysis program attempted to create general methodology necessary for such analysis, as well as information relevant to problem solving in the field of mineral economics. Major long-term research projects included the study and forecasting of demand, supply, and productivity; critical commodity analyses; mineral taxation; financial analysis; mineral transportation; international trade; input-output analysis; mining and land use; waste recycling; measures of economic activities stimulated by the mineral industries; a weekly price report on fuels and minerals; and a monthly report on major minerals. Some of the short-term projects undertaken in 1975 were the following: A study of the financial and corporate structure of U.S. coal companies, an examination of the methodology for determining strategic stockpile levels, the impact of new environmental standards on nonferrous smelting, economic evaluation of ocean mining, impact of the coal strike on raw steel production, economic impact of the oil refinery workers' strike, international commodity agreements, analyses of domestic and international mineral transport, a preliminary evaluation of proposed rail line abandonments in several Northeastern States, costs of various technologies for producing synthetic fuels, impact of natural gas curtailments in the mineral industries, investigation of economic models of the steel industry, cost-benefit analyses, U.S. policy on Arab investment in domestic minerals, and life-cycle analysis of elements in mineral and energy commodities.

Helium.—The Bureau of Mines has managed the Federal helium program in order to supply needed quantities and qualities for both Federal and commercial requirements. Helium is used in many applications for which an alternative material is either unavailable, uneconomic, or hazardous. The Helium Division conducts a worldwide survey to discover and evaluate new sources of helium-bearing natural gas. Research is conducted to improve methods of producing, storing, and using helium.

LEGISLATION AND GOVERNMENT PROGRAMS

Federal activities in the minerals sector dealt with energy as well as new and continuing programs in the areas of taxation, environmental quality, water resources, transportation, and tariffs and duties.

The $2-per-barrel special fee on imported crude oil and certain petroleum products, instituted in early 1975 in order to reduce dependence on imported oil, was discontinued in December. Price controls were maintained on some domestically produced crude oil and natural gas.

Changes in the Internal Revenue Code cut corporate tax liabilities by a gross amount of $4½ billion, including $2¾ billion resulting from liberalization of the investment tax credit. However, owing to repeal of percentage depletion for oil and gas and limitation of credits for U.S. corporations on foreign tax payments and deferral of taxes on income earned abroad, net corporate tax liabilities were reduced by only $2½ billion.

The Tax Reduction Act of 1975 (Public Law 94-12) affected the minerals sector through the following changes in the Internal Revenue Code: Repealed percentage depletion allowance for oil and gas integrated producers; substantially curtailed foreign tax credit benefits for overseas oil and gas operations; provided that any losses incurred on foreign oil-related income will be recaptured against future income by limiting foreign tax credits available; excluded depletable resources (oil, coal, and uranium, among others) from domestic international sales corporations (DISC) tax benefits; limited investment credit on offshore drilling rigs to those located in the northern part of the Western Hemisphere; and increased business investment credit from 7% to 10% (11% in certain instances) and from 4% to 7% for public utilities.

Public Law 94-99 and Public Law 94-133 extended the Emergency Petroleum Allocation Act of 1973 until September 16, 1975, and December 15, 1975, respectively. Public Law 94-163, the Energy Policy and Conservation Act, established a national domestic energy policy designed to increase domestic energy production, reduce consumption, and provide for emergency standby rationing. Price controls were extended 39 months with an immediate rollback of the average price of domestic oil from $8.75 per barrel to a ceiling of $7.66. This price ceiling could rise at a rate equal to the percentage rise in the GNP deflator between preceding quarters. The President could grant an additional 3% increase upon finding that such an increase would stimulate domestic petroleum production. The total price increase may not exceed 10% during the first year and any additional price increases by the President would be subject to disapproval by either House of Congress.

Public Law 94-83 provides that environmental impact statements for major federally-funded state projects, as long as certain criteria are met, may not be deemed legally insufficient solely for the reason that they were prepared by a State. Public Law 94-156 authorized the Secretary of the Interior to engage in feasibility studies of power intertie potentials for improving electric power transmission systems affecting 17 Western States, a geothermal energy utility system for a California city, and several other water projects. Public Law 94-5 authorized an additional $150 million in federally guaranteed loans and $197 million in grants for maintenance and continued services of railroads operating under the Regional Railroad Reorganization Act, the major portion of which will go to the Penn Central Railroad.

Two laws were enacted dealing with the National Commission on Supplies and Shortages (NCSS). Public Law 94-9 extended the deadline for filing its initial report to March 1, 1975. Public Law 94-72 extended the life of the NCSS until October 1, 1976. A listing of mineral related Federal legislation enacted during 1975 follows:

Public Law (P.L.)	Description	Signed into law
Taxes:		
94-12	Tax Reduction Act of 1975.	Mar. 29
Energy:		
94-99	To extend until Nov. 19, 1975, the Emergency Petroleum Allocation Act of 1973.	Sept. 29

Public Law (P.L.)	Description	Signed into law
Energy—Continued		
94–133	To extend for 1 month until Dec. 15, 1975, the Emergency Petroleum Allocation Act.	Nov. 14
94–163	Providing standby emergency authority to assure that essential energy needs of the United States are met.	Dec. 23
Environmental Quality:		
94–62	Authorizing $16.5 million through Sept. 30, 1976, for programs to regulate dumping of certain materials in the ocean waters and study areas to be designated as marine sanctuaries.	July 29
94–83	To clarify the State and Federal roles in preparing federally required environmental impact statements on Federal-aid highway projects.	Aug. 9
94–140	Extending for 2 years, through Sept. 30, 1976, authority of the Environmental Protection Agency to regulate pesticides and related chemicals.	Nov. 28
94–197	To revise the method of providing for public remuneration in the event of a nuclear incident.	Dec. 31
Water Resources:		
94–38	Authorizing funds for fiscal year 1976 for the saline water conversion program.	June 19
94–112	To extend authority for financial assistance to the States for water resource planning.	Oct. 16
94–156	Authorizing the Secretary of the Interior to engage in feasibility investigations of certain potential water resource developments.	Dec. 16
94–181	To amend the Small Reclamation Projects Act so as to improve and perfect programs involving utilization of water and related land resources.	Dec. 27
Public Lands/Land Use:		
94–31	To provide for a study of the enlarged Grand Canyon National Park for its possible inclusion in the wilderness system.	June 10
94–204	To continue until June 30, 1979, authority of the Joint Federal-State Land Use Planning Commission for Alaska.	Jan. 2, 1976
Tariffs and Duties:		
94–75	Providing for the temporary suspension (until Oct. 3, 1975) of the duty on catalysts of platinum and carbon imported for use in producing caprolactam.	Aug. 8
94–76	Providing for temporary suspension (until June 30, 1975) of duty on open-top hopper cars exported for repairs or alterations.	Aug. 8
94–89	Providing for temporary suspension (until June 30, 1978) of duties on zinc-bearing ores and certain other zinc-bearing materials.	Aug. 9
94–108	Extending until June 30, 1978, the period during which certain dyeing and tanning materials may be imported duty free.	Oct. 8
94–120	Suspending duty on natural graphite until June 30, 1978.	Oct. 21
Transportation:		
94–5	Authorizing additional interim funding for maintenance and continued service of railroads operating under the Regional Railroad Reorganization Act.	Feb. 28
94–56	Authorizing funds to carry out the purpose of the Federal Railroad Safety Act and Hazardous Material Transportation Act through Sept. 30, 1976.	July 29
Miscellaneous:		
94–9	Extending from June 30, 1975, until Dec. 31, 1975, certain authority contained in the Defense Production Act of 1950.	Mar. 21
94–42	To extend through Sept. 30, 1975, expiration date of the Defense Production Act and funding authority for the National Commission on Productivity and Work Quality.	June 28
94–152	Extending for 2 years, through June 30, 1977, provisions of the Defense Production Act.	Dec. 16
94–153	To amend the effective date of the Defense Production Act Amendments of 1975.	Dec. 16

The acquisition cost of strategic and critical materials in the national stockpile, as of December 31, 1975, was $2.6 billion with a current market value of $5.3 billion. The acquisition cost of materials in the supplemental and Defense Production Act stockpiles were $1.1 billion and $0.3 billion, respectively, with respective market values of $1.9 and $0.2 billion. The total acquisition cost of these materials was $4.0 billion with a market value of $7.4 billion. Materials in these inventories with an acquisition cost of $3.4 billion and a market value of $6.3 billion were considered to be in excess of stockpile needs. During 1975 disposals from the national and supplemental stockpiles totaled $107.9 million, which is less than 8% of that disposed of in 1974. Disposals from the Defense Production Act inventory and the other inventories were $10.4 million and $155.4 million, respectively, bringing the grand total disposed of to $273.6 million. Commodities with the greatest sales value included gold, $154.5 million; metallurgical manganese, $18.6 million; tungsten ores and concentrates, $18.4 million; and cobalt, $17.3 million.

WORLD REVIEW

World Economy.—In 1975, economic recovery from the worst post-World War II recession began in most major industrial countries. Inflation rates moderated relative to the preceding 3 years but continued at high levels by historical standards. Both unemployment and underutilized industrial capacity increased during the year. Capacity utilization rates for large industrial countries averaged about 75% in 1975. The volume of trade fell significantly worldwide for the first time in 30 years. World agricultural production increases in 1975 (excluding centrally planned economies in Asia, for which complete data are unavailable) were more than offset by world population increases.

Real GNP for the four largest industrial countries in Western Europe, and Canada and Japan declined at an average annual rate of 4.3% for the first half of 1975. For the year as a whole, real GNP declined 1.5% in the United Kingdom, 3.0% in France, 3.4% in West Germany, 4.5% in Italy, remained unchanged in Canada, and increased 2.2% in Japan. Downturns in most of these countries were caused by inventory liquidations; declines in investment in plant, equipment, and housing; and weaknesses in the external sector. These adverse developments stemmed, in turn, largely from the rapid increase in world oil prices since 1973, which was a major cause of the serious recession and slow recovery in oil consuming countries.

The only group of countries where significant growth occurred in 1975 was the Organization of Petroleum Exporting Countries (OPEC). OPEC imports rose sharply compared to 1974 as did the level of its domestic economic activity.

World Production.—The United Nations (UN) indexes of world mineral industry production (1970=100) for the extractive industries decreased 2 index points to 114 in 1975. The metal mining index declined 3 points to 106, the coal index rose 2 points to 98, and the crude petroleum and natural gas index dropped 4 points to 119. Indexes for the mineral processing industries showed declines of 7 points to 114 for base metals, 1 point to 125 for nonmetallic mineral products, and 1 point to 134 for chemicals, petroleum, and coal products. The UN index of overall industrial production fell 1 point to 126 in 1975.

World Trade.—The value of world export trade in all commodities rose 45% to $835.5 billion in 1974 (latest data available). The value of mineral commodity exports for 1974 was $263.1 billion, a 109% increase over the 1973 figure. For metals the value of exports increased more than 53% to $87.3 billion; within this group, iron and steel exports rose 63%, followed by nonferrous metals exports at 46%, and all ores, concentrates, and scrap exports at 40%. Crude nonmetal trade increased 43% to $5.8 billion. Mineral fuel exports rose in value to $170.1 billion, a 161% increase over the 1973 figure.

World Prices.—Mineral commodity export price indexes (1970=100) were somewhat higher in 1975 for all sectors. Metal ores rose by 25 index points to 200, fuels by 11 points to 588, and all crude minerals by 21 points to 494. Total minerals export prices increased 10% in developed areas and 3% in developing areas. Nonferrous base metal prices declined 16% in developed areas and 32% in developing areas.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available. W Withheld to avoid disclosing individual company confidential data.

[1] Net supply is sum of primary shipments, old scrap, and imports minus exports. Stockpile disposals are included in primary shipments. Gross supply is the total before subtraction of exports.

[2] Less than ½ unit.

[3] Erroneously reported in previous year.

Table 11.—Value of selected minerals and mineral products imported and exported by the United States in 1975, by commodity group and commodity[1]

(Thousand dollars)

SITC code[2]	Commodity	Exports	Imports
	Minerals, nonmetallic (crude):		
271	Fertilizers, crude	464,027	27,719
273	Stone, sand and gravel	37,811	26,962
274	Sulfur and unroasted iron pyrites	69,679	70,953
275	Natural abrasives (including industrial diamonds)	58,528	54,528
276	Other crude minerals	261,600	262,063
	Total[3]	891,645	442,227
	Metals (crude and scrap):		
281	Iron ore and concentrates	60,071	860,495
282	Iron and steel scrap	779,257	31,776
283	Ores and concentrates of nonferrous base metals	240,236	772,612
284	Nonferrous metal scrap	221,950	160,665
285	Silver, platinum, platinum-group metal ores and concentrates	52,315	134,412
286	Uranium and thorium ores and concentrates	1,840	531
	Total[3]	1,355,669	1,960,495
	Mineral energy resources and related products:		
321	Coal, coke, briquets (including peat)	3,343,033	202,298
331	Petroleum, crude and partly refined	187	19,250,291
332	Petroleum products, except chemicals	936,678	5,515,784
341	Gas, natural and manufactured	214,583	1,435,417
	Total[3]	4,494,481	26,403,791
	Chemicals:		
	Inorganic chemicals:		
513	Elements, oxides, halogen salts	608,177	724,875
514	Other inorganic chemicals	337,751	107,270
515	Radioactive and associated materials except uranium and thorium	315,180	195,477
521	Mineral tar and crude chemicals from coal, petroleum, natural gas	59,286	14,051
	Total[3]	1,320,394	1,041,675
	Minerals, nonmetallic (manufactured):		
661	Lime, cement, fabricated building material, except glass and clay	55,676	116,720
662	Clay and refractory construction materials	136,322	66,177
663	Mineral manufactures, not elsewhere specified	166,138	83,198
	Total	358,136	266,095
	Metals (manufactured):		
671	Pig iron, spiegeleisen, sponge iron, iron and steel powder and shot, ferroalloys	73,768	556,962
672	Iron or steel ingots and other primary forms	63,296	69,523
673	Iron or steel bars, rods, angles, shapes, sections	181,007	941,513
674	Iron or steel universals, plates, sheets	328,304	1,727,527
675	Iron or steel hoops and strips	62,310	67,400
676	Iron or steel rails and railway track construction materials	70,557	29,662
677	Iron or steel wire (excluding wire rod)	25,340	231,551
678	Iron or steel tubes, pipes, fittings	1,411,949	1,040,241
679	Iron or steel castings and forgings, unworked	240,637	30,852
681	Silver, platinum, and platinum-group metals	222,906	517,675
682	Copper and copper alloys	332,569	418,615
683	Nickel and nickel alloys	117,944	464,306
684	Aluminum and aluminum alloys	433,210	410,598
685	Lead and lead alloys	12,041	47,488
686	Zinc and zinc alloys	17,335	283,880
687	Tin and tin alloys	12,344	315,740
688	Uranium and thorium metals and alloys	203	5
689	Miscellaneous nonferrous base metals	164,039	122,007
	Total[3]	3,769,759	7,275,554
	Grand total	12,190,084	37,389,837

Chemical grade ... do	251	166	NA
Manganese ore (35% or more Mn) ... do	1,880	1,819	3,900
Molybdenum (Mo content) ... thousand pounds	63,476	51,689	188,000
Tungsten (W content) ... do	16,298	14,012	76,400
Nonferrous metals:			
Aluminum (apparent consumption) thousand short tons	5,918	4,737	28,400
Antimony, primary ... short tons	18,041	12,987	48,000
Copper, refined ... thousand short tons	2,194	1,535	7,100
Lead, primary and secondary ... do	1,599	1,297	2,730
Zinc, all classes ... do	1,673	1,232	3,090
Mercury, primary ... 76-pound flasks	59,479	50,838	102,000
Platinum-group metals ... thousand troy ounces	1,981	1,310	3,157
Silver (industrial consumption) ... do	176,027	157,650	420,000
Ilmenite and titanium slag (estimated TiO_2 content) short tons	683,533	536,994	1,840,000
Uranium (U_3O_8, estimated purchases by private industry) do	11,900	12,500	73,113
Nonmetals:			
Asbestos (apparent consumption) ... thousand short tons	846	605	2,430
Cement (apparent consumption) ... million short tons	83	72	NA
Clays (apparent consumption) ... thousand short tons	61,087	49,388	174,000
Lime (sold or used) ... do	21,606	19,133	NA
Phosphate rock (P_2O_5 content, apparent consumption) do	14,946	10,315	NA
Potash (K_2O content, apparent consumption) ... do	6,084	5,076	14,455
Salt (apparent consumption) ... do	49,373	42,913	158,900
Sand and gravel ... million short tons	979	789	3,200
Stone, crushed (sold or used) ... do	1,044	901	3,400
Sulfur, all forms (apparent consumption) thousand long tons	10,818	10,603	30,000
MINERAL ENERGY RESOURCES AND ELECTRICITY			
Bituminous coal ... million short tons	553	555	1,000
Coal carbonized for coke[1] ... do	(90)	(83)	(115)
Anthracite ... do	5	5	2
Petroleum production and natural gas liquids million barrels	6,078	5,954	14,500
Natural gas, dry[2] ... million cubic feet	21,223	19,538	49,000
Electricity generation, net ... million kilowatt hours	1,967,699	2,003,028	NA
Utilities ... do	1,866,414	1,918,126	[3] 8,650,000
Hydropower[4] ... do	313,741	307,660	[3] [5] 605,000
Nuclear power ... do	113,577	171,925	[3] 5,085,000
Conventional fuel-burning plants ... do	1,451,790	1,444,726	[3] 2,960,000
Industrial ... do	101,286	84,902	NA
Total energy resources inputs ... trillion Btu	72,668	70,558	[3] 163,430

• Estimate. [p] Preliminary. NA Not available.

[1] Figures in parenthesis are not added to totals.

[2] Residual gas excludes extraction loss but includes transmission loss.

[3] Dupree, W. G., Jr., and J. S. Corsentino. U.S. Energy Through Year 2000 (revised). U.S. Department of the Interior. December 1975, tables 1 and 15.

[4] Net generations adjusted for net imports or exports. The bulk of net trade is hydropower with an undetermined amount of steam plant power.

[5] Includes power produced at geothermal plants.

Table 15.—Production of mineral energy resources and electricity from hydropower and nuclear power

(Trillion Btu)

Year	Anthracite	Bituminous coal and lignite [1]	Natural gas, wet (unprocessed)	Crude petroleum [2]	Electricity [3]		Total
					Hydropower	Nuclear power	
1971	222	13,385	24,805	20,033	2,825	404	61,674
1972	181	14,319	24,792	20,041	2,866	576	62,775
1973	174	14,208	r 24,764	19,493	2,860	888	r 62,387
1974	168	14,319	23,689	18,575	3,177	1,211	61,139
1975 p	158	15,228	22,022	17,729	3,165	1,833	60,135

p Preliminary. r Revised.

[1] Heat values employed for bituminous coal and lignite are as follows: 1971, 12,120 Btu per pound; 1972, 12,025 Btu; 1973, 12,005 Btu; 1974, 11,865 Btu; and 1975, 11,750 Btu.

[2] Heat value employed for crude petroleum is 5,800,000 Btu per barrel, based upon an approximate API gravity of 36°, which is generally accepted as the average value of crude oil produced in the United States.

[3] Hydropower and nuclear power include installations owned by manufacturing plants and mines as well as Government and privately owned public utilities. The fuel equivalent of hydropower is calculated from the kilowatt-hours generated, converted to theoretical energy resources inputs calculated from national average heat rates for fossil-fueled steam-electric plants provided by the Federal Power Commission. Those heat rates are as follows: 10,478 Btu per net kilowatt-hour in 1971; 10,379 Btu in 1972; 10,389 Btu in 1973; 10,442 Btu in 1974; and 10,383 Btu in 1975. The fuel equivalent of nuclear power is calculated similar to hydropower, using an average heat rate of 10,660 Btu per net kilowatt-hour based on information from the Energy Research and Development Administration.

Table 16.—Calculated gross consumption of mineral energy resources and electricity from hydropower and nuclear power in British thermal units (Btu) and percent contributed by each [1]

1975 p	.2	18.0	(3)	28.3	43.0	3.4	4.5	2.6	100.0

p Preliminary. r Revised.

[1] Heat values employed are as follows: Anthracite, 12,700 Btu per pound and bituminous coal and lignite, weighted average British thermal units provided by the Division of Coal; 11,980 Btu per pound in 1971; 11,875 in 1972; 11,825 in 1973; 11,535 in 1974; and 11,400 in 1975. Btu values for petroleum products obtained by using 5,248,000 Btu per barrel for gasoline; 5,355,000 Btu per barrel for naphtha-type jet fuel; 5,670,000 Btu for kerosine and kerosine-type jet fuel; 5,825,000 Btu for distillate; 6,287,000 Btu for residual; 6,065,000 Btu for lubricants; 5,537,000 Btu for wax; and weighted average for all products applied to miscellaneous. Natural gas dry, 1,031 Btu per cubic foot in 1971; 1,027 in 1972; 1,021 in 1973; 1,024 in 1974; and 1,021 in 1975; natural gas liquids, weighted average British thermal units: Natural gasoline and other products, 110,000 Btu per gallon; LPG 95,500 Btu per gallon; ethane, 73,390 Btu per gallon; and plant condensate 129,000 Btu per gallon beginning in 1973. The fuel equivalent of hydropower is calculated from the kilowatt-hours generated and imported, converted to theoretical energy inputs calculated from national average heat rates for fossil-fueled steam-electric plants provided by the Federal Power Commission as follows: 10,478 Btu per net kilowatt-hour in 1971; 10,379 in 1972; 10,389 in 1973; 10,442 in 1974; and 10,383 in 1975. Energy inputs for nuclear power are converted at an average heat rate of 10,660 Btu per net kilowatt-hour based on information from the Energy Research and Development Administration.

[2] Energy from net imports of coke (2,262,000 tons in 1974 and 546,075 tons in 1975 at 13,000 Btu per pound). The remainder of coke consumption is accounted for in utilizing the gross total Btu value of coal carbonized for coke.

[3] Less than ½ unit.

p Preliminary. r Revised. NA Not available.

[1] Energy from net imports of coke (2,262,000 tons in 1974 and 546,075 tons in 1975). The remainder of domestic coke consumption is accounted for in utilizing the gross total Btu value of coal carbonized for coke.

[2] Excludes natural gas liquids.

[3] Petroleum products including still gas, LPG, and natural gas liquids.

[4] Outputs of hydropower (adjusted for net imports) are converted to theoretical energy inputs using national average heat rates for fossil-fueled steam-electric plants provided by the Federal Power Commission. The heat rates are as follows: 1971, 10,478 Btu per net kilowatt-hour; 1972, 10,379; 1973, 10,389; 1974, 10,442; and 1975, 10,383.

[5] Energy inputs for nuclear powerplants are calculated using an average heat rate of 10,660 Btu per kilowatt-hour, based on information from the Energy Research and Development Administration.

[6] Excludes electricity generated by non-utility plants, the energy inputs to which are included in the other inputs of the final consuming sectors. Distribution to sectors is based on sales reported in the annual issues of the Edison Electric Institute Statistical Yearbook of the Electric Utility Industry. Conversion of electricity to energy equivalent by sectors was made at the theoretical value of contained energy of 3,412 Btu per kilowatt-hour.

[7] Includes bunkers and military uses.

[8] Utility electricity, generated and imported, distributed to the final consuming sectors.

[9] Also termed "net energy inputs."

[10] Conversion losses in the electricity generation (utilities) sector. Total energy inputs to this sector is the sum of conversion losses and utility electricity distributed (footnote 8).

[11] Data may not add to totals shown because of independent rounding.

[12] Also termed "gross energy inputs."

p Preliminary. NA Not available.

[1] Includes use by producers for power and heat.

[2] Includes shipments to U.S. Armed Forces in West Germany.

[3] Except for small quantities used as raw material for coal chemicals, all anthracite is used for fuel and power.

[4] Data represent "retail deliveries to other consumers." These are mainly household and commertial users, with some unknown portion of use by small industries.

[5] Includes consumption by coke plants, steel and rolling mills, and other industrial uses. Adjusted to exclude coal equivalent of raw material use.

[6] Figures in parenthesis are not added into totals.

[7] Includes bunkers and military transportation.

[8] Coal equivalent based on British thermal unit value of raw material consumption of coal chemicals listed.

p Preliminary. r Revised.

[1] Marketed production represents gross withdrawals less gas used for repressuring and the quantities vented and flared. British thermal unit value of production is for wet gas prior to extraction of natural gas liquids. Higher Btu values assigned to extraction loss represent the Btu value of natural gas liquids production for each year.

[2] Extraction loss from cycling plants represents offtake of natural gas for natural gas liquids as reported to the Bureau of Mines. Energy equivalent of extraction loss is based on annual outputs of natural gasoline and associated products at 110,000 Btu per gallon, annual outputs of LPG at 95,500 Btu per gallon, annual outputs of ethane, since 1967, at 73,390 Btu per gallon, and beginning with 1973, energy equivalent for plant condensate is computed at 129,000 Btu per gallon.

[3] Domestic production is the marketed production less the shrinkage resulting from the extraction of natural gas liquids.

[4] Figures in parenthesis are not added into totals.

[5] Transmission loss and unaccounted for was formerly included in the industrial sector.

[6] Includes deliveries to municipalities and public authorities for institutional heating, street lighting, etc., formerly included in the industrial consuming sector.

[7] Includes some fuel and power used by raw material industries.

[8] Estimated from partial data.

NOTE.—Conversion factors for dry gas are as follows: 1971, 1,031 Btu per cubic foot; 1972, 1,027; 1973, 1,021; 1974, 1,024; and in 1975, 1,021.

p Preliminary.

[1] Supply and demand for crude oil and petroleum products. Petroleum products include products refined and processed from crude oil, including still gas and liquefied refinery gas; also natural gas liquids transferred from natural gas.

[2] Btu values for natural gas liquids for each year shown are implicitly derived from weighted averages of major natural gas liquids, with natural gasoline and other products at 110,000 Btu per gallon, liquefied petroleum gases at 95,500 Btu per gallon, ethane at 73,390 Btu per gallon, and plant condensate at 129,000 Btu per gallon.

[3] Btu values for imported and exported refined products for each year shown are totals of the Btu values of the respective products imported and exported.

[4] Includes natural gas liquids other than those channeled into refinery input as follows: Petrochemical feedstocks, direct uses for fuel and power, and other uses.

[5] Includes bunkers and military fuel uses.

[6] Includes some fuel and power use by raw materials industries.

---

[p] Preliminary.
[1] Includes liquefied refinery gas and natural gas liquids.
[2] Includes bunkers, military transportation, and all military use of distillate and residual fuel oils.
[3] Includes secondary recovery of petroleum and agriculture uses.
[4] Includes some fuel and power used by raw materials industries.
[5] Lubricants are distributed on basis of data from Bureau of the Census.
[6] Includes portions of petroleum coke estimated to be consumed in nonfuel uses.
[7] Includes ethane.
[8] Includes LPG for synthetic rubber.

Table 31.—Comparative mineral energy resource prices

Fuel	1973	1974	1975
Bituminous coal, average price at merchant coke ovens dollars per net ton	19.77	34.20	52.63
Anthracite, average sales realization per net ton at preparation plants, excluding dredge coal:			
Chestnut dollars	19.30	31.06	• 42.15
Pea do	16.98	27.61	• 39.50
Buckwheat, No. 1 do	16.61	28.36	• 38.40
Petroleum and petroleum products:			
Crude petroleum, average price per barrel at well do	3.89	6.74	8.00
Gasoline, average dealers' net price (excluding taxes) of gasoline in 55 U.S. cities[1] cents per gallon	19.48	30.53	35.78
Residual fuel oil:[1]			
No. 6 fuel, maximum 1% sulfur, average of high and low prices at Philadelphia[2] dollars per barrel	[3] 4.85	11.95	12.26
No. 6 fuel, maximum 0.3% sulfur, average of high and low prices at Philadelphia[2] do	5.68	13.11	13.16
Bunker C, average of high and low prices at all gulf ports do	3.42	[3] 10.28	9.30
Distillate fuel oil:[1]			
No. 2 distillate, average of high and low prices at Philadelphia cents per gallon	[3] 12.67	25.26	29.19
No. 2 distillate, average of high and low prices at all gulf ports do	[3] 21.74	[3] 30.69	28.43
Natural gas:			
Average U.S. value at well cents per thousand cubic feet	21.6	30.4	• 43.5
Average U.S. value at point of consumption do	66.5	88.8	• 115.0

• Estimate.

1975 [p]	126	121	60	NA

[p] Preliminary. [r] Revised. NA Not available.

[1] Index of labor costs per unit of output: Iron ore and copper indexes are computed from data found in U.S. Department of Labor, Employment and Earnings and Wholesale Price Indexes. Bituminous coal index based upon net tons per man per day (see chapter on Bituminous Coal) and index of average earnings derived from Bureau of Labor Statistics data on hourly earnings; petroleum index based on barrels per year (see chapter on Petroleum) and Bureau of Employment Security data on total wages in petroleum production.

Index of value of product per man-period: Iron ore and copper indexes are computed from data found in U.S. Department of Labor, Employment and Earnings and Wholesale Price Indexes. Bituminous coal index based on net tons per man per day and mine value of production; petroleum index based on average employment and total value of production.

Index of labor costs per dollar of product: Iron ore and copper indexes are computed from data found in U.S. Department of Labor, Employment and Earnings and Wholesale Price Indexes. Bituminous coal index based on index of value per man per day and index of average earnings; petroleum index based on total value of production and total wages.

[2] Indexes are for recoverable metal.

[3] Corrected figure.

Table 37.—Price indexes for selected items in minerals and mineral fuels production

(1967=100)

Commodity	1975		Percent change from January	Annual average		Percent change from 1974
	January	December		1974	1975	
Coal	428.8	371.2	−13.4	332.4	385.8	+16.1

Total mineral products [4]	58.5	59.7	+2.1	83.2	82.2	−1.2

---

[1] Revenue freight originated on respondent's road and terminated on line by originating carrier or delivered to connecting rail carrier.

[2] Domestic traffic includes all commercial movement between points in the United States, Puerto Rico, and the Virgin Islands.

[3] Includes lubricants, naphtha, and other petroleum solvents, and miscellaneous coal and petroleum products.

[4] Data may not add to totals because of independent rounding.

Department of the Army, Corps of Engineers, Waterborne Commerce of the United States, Part 5. National Summaries, Calendar years 1973 and 1974, table 2.

Table 49.—Percentage distribution of mine shipments of bituminous coal and lignite by method of shipment and mine use

Year	Shipped by rail and trucked to rail	Shipped by water and trucked to water	Trucked to final destination	Used at mines [1]	Total production
1971	69.2	10.7	10.9	9.2	100.0
1972	66.2	11.7	11.0	11.1	100.0
1973	67.1	11.5	9.8	11.6	100.0
1974	[2] 77.1	([2])	11.0	11.9	100.0
1975	64.5	10.7	12.2	12.6	100.0

[1] Includes coal used at mine for power and heat, made into beehive coke at mine, used by mine employees, used for all other purposes at mine, and transported from mine to point of use by conveyor, tram, or pipeline.

[2] Bituminous coal and lignite shipped by water included with that shipped by rail.

Table 50.—Miles of utility gas main, by type of main [1]

(Thousands)

Type of main	1970	1971	1972	1973	1974
Field and gathering	66.6	66.5	67.1	[2] 66.2	67.0
Transmission	252.6	r 254.8	r 258.5	r 263.6	263.5

Table 54.—Bureau of Mines obligations for mining and mineral research and development

(Thousand dollars)

Fiscal year	Applied research	Basic research	Development	Total
1972	32,805	7,846	30,237	70,888
1973	34,591	6,863	36,053	77,507
1974	24,880	5,637	35,590	66,107
1975	50,977	1,935	48,717	101,629
1976 [e] [1]	79,000	900	59,070	138,970

[e] Estimate.

[1] Does not include transition quarter.

Table 55.—Bureau of Mines obligations for total research, by field of science

(Thousand dollars)

Field	Fiscal year		
	1974	1975	1976 [e] [1]
Engineering sciences	23,909	47,712	73,885
Physical sciences	5,294	1,885	2,065
Mathematical sciences	477	1,285	1,580
Environmental sciences	837	2,030	2,370
Total	30,517	52,912	79,900

[e] Estimate.

[1] Does not include transition quarter.

Table 56.—Summary of Government inventories of strategic and critical materials December 31, 1975

	Acquisition cost	Market value [1]
Total inventories in storage:		
National stockpile	$2,554,757,000	$5,258,909,800
Supplemental stockpile	1,095,071,000	1,947,922,700
Defense Production Act	310,408,900	225,886,700
Total on hand	3,960,236,900	7,432,719,200
Total inventories within objective (in storage)	524,678,200	1,112,436,500
Total excess inventories in storage	3,435,558,700	6,320,282,700

[1] Market values are computed from prices at which similar materials are being traded; or in the absence of current trading, at an estimate of the price which would prevail in commercial markets. Prices used are unadjusted for normal premiums and discounts relating to contained qualities, or for inherent materials-handling allowances. Market values do not necessarily reflect the amount that would be realized at time of sale. The uncommitted excess excludes the unshipped sales; the inventories in storage include quantities that have been sold but not shipped.

p Preliminary. r Revised.

[1] Data presented are for selected major commodity groups of the Standard International Trade Classification—Revised (SITC–R), and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC–R categories included are as follows: Ores, concentrates, and scrap—SITC Division 28; iron and steel—SITC Division 67; nonferrous metals—SITC Division 68; nonmetals (crude only)—SITC Division 27; mineral fuels—SITC Division 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and crude chemicals from coal, petroleum, and natural gas of SITC Division 52; manufactured fertilizers of SITC Division 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667.

Mining and Quarrying Trends in the Metal and Nonmetal Industries

By John L. Morning [1]

MINING TRENDS

Although faced with a slowdown in the world economy, continued inflation, and rising costs, the mining industry exceeded its 1974 raw mineral production value of $55.1 billion by 13%. The increase was due to value increases in the production of fuels and nonmetals; metals reported a decrease in value. Of 23 metals produced, 14 showed value increases; of 44 nonmetals produced, 26 reported value increases.

Because of increasing costs and depletion of high-grade reserves, the mining industry continued to rely on new technologies to maintain its profit margins. In the surface mining sector, the development of new tools and equipment played a large part in increasing production and maintaining this goal. Some of the types of equipment developed were instrumentation for control of pit slope stability, shovel power transmissions, electric wheel trucks, and single-flight conveyor systems.

Equipment developed for control of pit slope stability was in the form of survey instrumentation which included optical-scale theodolites and optical-micrometer theodolites, the former capable of direct readings to 1 minute of arc and the latter capable of direct readings to 1 second. Through the use of these instruments, a complete picture of pit crest movement plus information on areas of potential slope failure is obtained.

The design and development of 12- to 25-cubic yard electric shovels for hardrock surface mining came about through the latest advances in solid state electronics. This totally static solid state electronic system permits the conversion of alternating current to direct current without the use of rotating machinery. By this means, torque overloads are eliminated, reducing the mechanical maintenance required. This enables electric shovel availability to remain at its customary 90% to 95%, regardless of the increase in size of equipment.

The 350-ton off-the-highway truck, the latest development toward larger earthmoving equipment, went into operation early in the year. Powered by a 3,300-horsepower diesel engine, the unit has four electric traction motors mounted within the rear wheels. Fully loaded, the total weight is over 600 tons. This unit is thought to be the ultimate limit for truck size, owing mainly to tire capacity and the adverse effect on pit haulage roads.

Replacing truck haulage by other haulage means, whether by conveyors or pipelines, is a problem faced by every open pit operation because truck haulage represents one-half of the total mining cost. Conveyors are generally favored owing to simplicity of operation and maintenance. To date the need to use numerous individual conveyors to carry material long distances has limited their application; however, the development of a single-flight conveyor system for use at unlimited distances may provide the needed breakthrough. The unlimited distance is obtained by the use of numerous intermediate drive modules. Each module consists of a primary driving mechanism driving rubber tires positioned above and between the top and bottom strands of belting. The developers claim that this method will eliminate to a great degree the need for multiflight conveyors and costly transfer points.

---

[1] Supervisory physical scientist, Division of Ferrous Metals.

Problems faced by the underground mining industry were the same as those of the surface mining industry—increasing costs, inflation, labor problems, environmental constraints, etc. To retain economic stability, the industry developed new haulage methods, new roof control techniques, and new blasting techniques.

Underground haulage is rapidly changing from the track to the trackless system. Surveys indicated that 75% of all noncoal underground haulage in 1975 was trackless, and load-haul-dump (LHD) units predominated. The change to diesel-powered LHD units permits greater flexibility, higher productivity, and lower maintenance cost. Trends now indicate that the next change will be to larger units in the near future.

Because of increasing depth and extraction rates, roof control problems are also increasing. The switch from standard roof bolts to fully grouted bolts, although at present very gradual, indicates this to become the practice of the future. Bonding by grouting prevents not only anchor slip but also rock spalling at the hole collar. Grouts in use at present are resin and cement; cement is by far the cheaper. Further, remote bolting, as demonstrated by the Bureau of Mines' Inherently Safe Mine Systems Demonstrations, at the Jenny mine in Prestonburg, Ky., and the Peabody No. 10 mine near Springfield, Ill., is feasible, and remote grouting is a certainty in the future.

The drill-blast-load cycle in mining has been under study for some time. Most recently, changes in the blasting phase have been predominant. The quantity of high explosives used in the minerals industry has been decreasing for a number of years, and use of ammonium nitrate-fuel oil (AN-FO) products and water gels has been increasing. The reasons are twofold: (1) Safer handling and (2) ease of handling. The new explosives generate a substantially reduced amount of noxious gases and are extremely low in sensitivity. Also, these explosives can be loaded more easily and quickly than the standard dynamite.

Magnitude of the Mining Industry.—The number of metal and nonmetal mines increased from 14,775 in 1966 to 15,014 in 1975, primarily because of increases in sand and gravel and crushed and broken stone operations. However, the number of metal mines decreased from 1,631 to 609, and nonmetal mines, excluding sand and gravel and stone operations, decreased from 1,914 to 1,814 for the same years.

In the past decade, many small metal mines have become inactive, while mines with over 10 million tons of crude ore output per year increased to 16 from 10 in 1966. Total nonmetal mines, however, have increased in number during the interval, and those having over 10 million tons of crude ore output increased to nine from four in 1966. Copper (10), iron ore (5), and molybdenum (1) accounted for the large metal mines, and phosphate rock (7), sand and gravel (1), and stone (1) accounted for the large nonmetal mines in 1975.

Crude ore output during the 10-year period increased from 2.5 billion tons to 2.6 billion tons, and total material handled rose from 3.5 billion tons to nearly 4.2 billion tons. In addition, in 1975 there were 112 wells, ponds, or pumping operations producing 10 commodities. Output of crude ore from individual mines ranged from 1 to nearly 42 million tons, and total material handled ranged from 1 to nearly 150 million tons.

Output of crude ore at the 25 leading metal mines totaled over 403 million tons, a decrease of about 2.5% compared with that of 1974, and accounted for 66% of total crude ore from metal mines. In terms of total material handled, the 25 leading metal mines moved over 1.2 billion tons, nearly 2% less than in 1974.

Output of crude ore at the 25 leading nonmetal mines totaled nearly 218 million tons, a 10% increase compared with that of 1974. Total material handled by the 25 leading nonmetal mines totaled nearly 407 million tons, a decrease of 3% from that of 1974, and accounted for 17% of total material handled at nonmetal mines.

Three iron ore open pit mines—the Minntac of the United States Steel Corp., the Erie Commercial of Pickands Mather & Co., and the Peter Mitchell of Reserve Mining Co.—headed the list of metal mines in output of crude ore. The Minntac retained its leadership role while the Utah

Copper mine of Kennecott Copper Corp. fell to fifth place compared with the 1974 listing. The Twin Buttes mine in Arizona of Anamax Mining Co. headed a listing of mines in terms of total material handled, primarily because of stripping operations.

The Payne Creek mine of Continental Oil Co. producing phosphate rock took over the leadership in crude ore output for nonmetal mines, replacing the Suwannee mine of Occidental Petroleum Corp., which fell to second in the listing. The Haynsworth mine of American Cyanamid Co., also producing phosphate rock, was the leader in total materials handled.

Copper mines (12) and iron mines (10) dominated the list for crude ore output at metal mines, while phosphate rock mines (17) dominated the list for nonmetal mines. The same commodities headed the listings for total material handled. Arizona and Minnesota with six mines each headed the list of the 25 leading metal mines in output of crude ore, while Florida with 17 mines had the most mines in the top 25 large nonmetal mines for output of crude ore.

Materials Handled.—The U.S. mineral-producing industry, excluding fuels, handled nearly 4.2 billion tons of crude ore and waste in 1975, 9% less than in 1974 but 18% more than a decade earlier. Of the total, crude ore comprised 63%. Material handled at both metal and nonmetal mines was lower than in 1974—metals by 60 million tons and nonmetals by 350 million tons. The decrease in material handled at metal mines was primarily due to reduced activity at copper operations, while the decrease at nonmetal mines was caused by reduced demand for construction minerals.

Crude ore output at metal mines decreased 3%, while output decreased 13% at nonmetal operations. Despite the off year in crude ore production at copper mines, notable gains in crude ore production was made by gold and silver. The decrease in production at nonmetal mines resulted from lower output at sand and gravel and stone operations. Phosphate rock production, however, increased 20%.

Four commodities—copper, iron ore, titanium (ilmenite), and molybdenum—accounted for 93% of metal crude ore output and 87% of total material handled at metal mines. Clays, phosphate rock, sand and gravel, and stone furnished 96% of the crude ore and 95% of total material handled at nonmetal mines.

In 1975, 11 States each reported more than 100 million tons of total material handled, 3 fewer than in 1974. As in past years, Arizona was the leader, followed by Florida and Minnesota. Together the three States handled 33% of the U.S. total material handled. The leading States in tonnage of crude ore mined were Florida, Minnesota, and Arizona.

Value of Principal Mineral Products.—When possible, the measurement of value used in table 4 is for crude ore treated or, in the case of some nonmetals, crude ore shipped.

Average value for all commodities increased 11% compared with that of 1974. Compared with a decade earlier, average value increased 76%. For metal commodities, average values increased for about one-fourth of the commodities, but this was more than offset by a decrease in value for the other commodities; total average value decreased 2% compared with that of 1974. Among the large-volume commodities, copper decreased 17% while iron ore increased 18%. For nonmetal commodities nearly all indicated an increase in average value; overall average value rose 19%. Among the nonmetals, perlite (49%) and phosphate rock (84%) indicated significant increases in average value.

Byproducts contributed to the average value of two-thirds of the mineral commodities listed in table 4. The value of byproducts was a significant part of total value for metals such as bauxite, 50%; copper, 10%; lead, 38%; silver, 14%; and zinc, 17%, and for the nonmetals such as feldspar, 45%; fluorspar, 29%; and salt, 15%.

With the exception of talc, soapstone, and pyrophyllite, value of products at underground mines was substantially higher than at surface mines. Byproducts accounted for 10% of the average value of metal ores and 1% of nonmetal ores value. Excluding the large-volume commodities of sand and gravel and stone, byproducts contributed 2% to the value of nonmetals and 7% to the average value of metals and nonmetals. Average value for metals and nonmetals, excluding sand and gravel and stone, was 7% higher than in 1974.

Ratio of Ore Treated to Marketable Product.—The ratio of ore treated to marketable product—that is, the amount of ore processed to produce 1 unit of marketable product—varies with the type of mineral commodity. The ratio ultimately depends on the grade of ore treated and type of valuable mineral content. For many of the nonmetal commodities, the ratio is essentially 1 to 1. Ratios are significantly lower for underground mines than for surface mines for a specific commodity because of higher underground mining costs. The historical trend for most mineral commodities that are concentrated has been an increase in ratio as ores with smaller valuable mineral contents are mined and processed.

Comparison of Production From Surface and Underground Mines.—Historically, there is little annual change in the percentages of crude ore mined and total material handled by surface mines and underground mines. In 1975, surface mines accounted for 94% of crude ore production and 96% of total material handled. This compares with 94% and 95%, respectively, for crude ore and total material handled in 1966. However, changes occur for various commodities. Metal surface mine percentages for crude ore output and total material handled during the past decade increased from 83% and 92%, respectively, in 1966 to 88% and 95% in 1975. In particular, crude iron ore production from surface operations increased from 91% in 1966 to 96% in 1975, and copper crude ore output increased from 85% in 1966 to 89% in 1975.

Nonmetal mine percentages for crude ore production and total material handled have remained essentially the same because of the large-volume commodities of sand and gravel and stone. Many smaller volume nonmetal commodities, however, have shown a shift to surface operations during the 10-year period.

Two metal commodities, antimony and lead, and three nonmetal commodities, potassium salts, sodium carbonate, and wollastonite, were entirely mined by underground methods. Crude ore production of 10 metals and 19 nonmetals came entirely from surface mines.

Exploration and Development.—Exploration and development footage continued the upward trend of the previous year, increasing 22% over that of 1974. Development footage decreased slightly from that of 1974, as exploration work increased 24%. Metal exploration work increased 26%, while nonmetal exploration decreased 17% compared with that of 1974.

Metal mining accounted for 64% of the total development and 98% of the total exploration performed. The major portion of development activity for nonmetallic ores was in sodium carbonate, potassium salts, and phosphate rock, whereas the majority of development work in metallic ores was in uranium, copper, zinc, and lead. Exploration work was conducted to the greatest extent for fluorspar, phosphate rock, and gypsum for nonmetals, and for uranium, gold, copper, and zinc for metals.

The above nonmetals accounted for 97% of the total development activity and for 53% of the total exploration, while the above metals accounted for 71% and 94% of the total development and exploration activities, respectively.

Wyoming, New Mexico, South Dakota, Colorado, and Texas all had over 1 million feet of combined exploration and development activity during 1975; percentages of the total were Wyoming (28), New Mexico (26), South Dakota (13), Colorado (5), and Texas (4). Other States with significant activity were Washington, Utah, Montana, Alabama, Arizona, and Nevada.

Stripping produced the most development materials handled, accounting for 96% of the total. Arizona, from its copper activity, led with 52% of the stripped material produced. Stripping for iron ore in Michigan and Minnesota, uranium in Wyoming, and phosphate rock in Idaho contributed significant amounts to the total produced. Colorado accounted for the most material produced from shaft and winze sinking, Arizona the most from raising, and Wyoming the most from drifting, crosscutting, and tunneling.

Explosives.—Apparent consumption of industrial explosives in the United States during 1975 reached a record high for the seventh consecutive year and exceeded 3 billion pounds for the first time. Increased coal production accounted for the increased consumption as usage in all other categories decreased. Of the total industrial consumption of explosives, the minerals industry used, 83%. Coal mining consumed, 53%; quarrying and nonmetal mining, 16%; metal mining, 14%; and all other uses, 17%.

Of the nearly 2.6 billion pounds of explosives used in the minerals industry, coal mining accounted for 64%, quarrying and nonmetal mining, 19%, and metal mining, 17%.

Of the explosives consumed in the minerals industry, coal mining used 97% of the permissible explosives, 90% of cylindrical packed blasting agents, and 70% of bulk blasting agents (other processed blasting agents and unprocessed ammonium nitrate). Other high explosives were consumed primarily in quarrying and nonmetal mining, 55%. The chief use of water gels and slurries was in metal mining, 65%.

Kentucky, Pennsylvania, and Alabama were the leading States in explosive consumption for coal mining, accounting for 55% of the total. Arizona, Minnesota, and New Mexico were leading States in consumption of explosives for metal mining, accounting for 63% of the total. For quarrying and nonmetal mining, Ohio, Pennsylvania, and Illinois were leading States, accounting for 24% of the explosives used in this category.

More detailed explosives information is published in the Annual Explosive issue of Mineral Industry Surveys, prepared by the Division of Nonmetallic Minerals, Bureau of Mines.

FLOTATION TRENDS[2]

During the past 5 years, the greatest emphasis in froth flotation continued to be directed toward the design and development of new flotation machines and improvements in existing ones. One reason for changes concerns mixing efficiency. Studies have revealed that air and solids impair mixing, thus leading to the development of flotation machines in which the flow pattern in the tank includes the recirculation of a large portion of the pulp in the impeller region. Other machines being developed are of the countercurrent type with deep cells and mechanical dispersers. A machine of this design was recently developed in the Soviet Union; it not only requires less maintenance but also uses one-fifth less electrical energy than conventional cells.

A second area of effort is in the search for new reagents. Although some 300 types of commercial flotation reagents are available, research to replace expensive reagents by cheaper ones continues. Research is also being conducted to develop reagents that have high selectivity.

Another area of flotation processing receiving attention is that of automation. Plants utilizing up-to-date measuring and controlling devices are on the increase. X-ray analysis and computer control are the main methods being employed. Although the instruments needed are costly, pulp consistency measurements allow for better quality control and higher recoveries. Accurate and reliable measurement of reagent feeding is also important in the flotation process. Automatic control is, therefore, of primary concern.

In the future, beneficiation by flotation will require more sophisticated reagents, machines, and control systems in order to treat ever-increasing tonnages, especially as it becomes necessary to utilize ores from lower grade deposits.

Every 5 years the Bureau of Mines conducts a survey of flotation plants in the United States in order to determine trends in this small but important industry. The growth of froth flotation in the minerals industry of the United States during the last 15 years has been determined by comparing data collected for 1960, 1965, 1970, and 1975.

The 252 flotation plants reported operating in 1975 represented a 30% increase over the 194 reporting in 1960. However, the combined daily capacity, 1,612,000 tons, of the plants in 1975 was more than double the 730,000 tons of 1960.

Significant gains were registered in quantity of material treated and in production of concentrates. In 1975, the nearly 423 million tons of ore treated was more than double the 198 million tons processed in 1960. The production of 60.3 million tons of concentrate in 1975 was nearly three times the 21.5 million tons produced in 1960.

Of the total ore treated by flotation in 1975, 66% was metal sulfides, 7% metal oxides and carbonates, 24% nonmetallic minerals, and 3% solid mineral fuels. Comparable data for 1960 showed that metal sulfides accounted for 78%, metal oxides and carbonates 2%, nonmetallic minerals 18%, and solid mineral fuels 2%.

About 30 mineral-bearing materials were treated by flotation in 1975, led by the ores of copper, copper-molybdenum, iron, molybdenum, phosphate rock, potash, and coal. Since 1960 the largest growth rates were reported for flotation of iron ore, phosphate rock, and coal.

Although the consumption of 1,769 million pounds of flotation reagents in 1975 was double that of 1960—corresponding to the growth in quantity of material treated by flotation—the value of the reagents consumed rose fourfold to $87.7 million in 1975.

Significant trends that continued or emerged in froth flotation included the continued treatment of large and increasing quantities of copper and copper-molybdenum ores, the continued decline in grade of copper-bearing ores, the continued rapid growth in flotation of iron ore, phosphate rock, and bituminous coal, and the emerging spiraling costs of flotation reagents.

Consumption of Energy, Water, and Grinding Media, Including Mill Liners.—Energy consumption in kilowatt-hours per ton of ore processed at flotation plants remained relatively constant during 1960–75, averaging 16.2 in 1960, 15.4 in 1965, 15.3 in 1970, and 15.8 in 1975. However, the increase in quantity of ore treated at flotation plants resulted in a corresponding increase in total energy consumption, which rose from 3,210 million kilowatt-hours in 1960 to 6,541 million kilowatt-hours in 1975. Total energy consumption includes all energy used in the various processes inherent to the flotation plant, such as crushing, grinding, classifying, flotation, filtering, and material handling.

---

[2] Prepared by Gertrude Greenspoon, mineral specialist, Division of Nonferrous Metals, and John L. Morning, supervisory physical scientist, Division of Ferrous Metals.

The average quantity of water used per ton of ore processed in the flotation plants rose slightly, from 1,140 gallons in 1960 to 1,270 gallons in 1975. Again, corresponding to the increase in quantity of material treated, water used at flotation plants increased from 222 billion gallons in 1960 to more than 527 billion gallons in 1975. Total water quantities are reported, including both recirculated and new or makeup water.

Data on the use of grinding media in flotation plants have been available only since 1965. Generally, the total quantities used increased in proportion to the quantity of ore treated. For example, during 1965–75, rod consumption rose from 50.3 million pounds to 72.6 million pounds, ball consumption increased from 201.7 million pounds to 405.9 million pounds, and liner consumption went from 16.9 million pounds to 36.2 million pounds. Corresponding use of grinding media in pounds per ton of ore treated in 1965 and in 1975 follows: Rods, 0.55 and 0.46; balls, 1.09 and 1.31; and liners, 0.14 and 0.12.

Consumption of Reagents.—Reflecting the twofold increase in quantity of ore treated, the total consumption of flotation reagents also doubled, rising from slightly more than 850 million pounds in 1960 to nearly 1,769 million pounds in 1975. At the same time, the average consumption of reagents per ton of ore treated remained relatively constant, 4.3 pounds in 1960, 4.5 pounds in 1965, 5.1 pounds in 1970, and 4.2 pounds in 1975. Except for minor variations, the use of reagents per ton of ore treated fell for modifiers, collectors, frothers, and flocculants, remained about the same for activators, and rose for depressants.

Value of reagents consumed totaled $21.8 million in 1960, $31.0 million in 1965, $50.9 million in 1970, and $87.7 million in 1975. Concurrently, the average cost of reagents per ton of ore treated was $0.11 in 1960 and in 1965, $0.13 in 1970, and $0.21 in 1975.

The following classification of reagents is used in this report:

Modifiers.—Reagents used to control alkalinity and to eliminate harmful effects of colloidal material and soluble salts.

Activators.—Reagents used to assist or improve the flotation of minerals that do not respond to a simple collector-froth combination.

Depressants.—Reagents used to improve the selective separation of minerals by lowering the floatability of specific minerals.

Collectors.—Reagents used to provide a water-repellent surface on the mineral to be floated so as to improve adherence of the mineral to air bubbles.

Frothers.—Reagents used to produce a froth of adequate durability to permit removal of mineral-carrying bubbles from the flotation machine.

Flocculants.—Reagents used to flocculate solids in aqueous suspension and thereby facilitate thickening and filtering operations.

Also, to avoid disclosing confidential information, some reagents are not identified but are included under "other," or information on two or more reagents is combined.

Distribution of Flotation Plants.—The 252 flotation plants operating in 1975 were located in 35 States. West Virginia led with 34 plants, followed by Arizona (21), Florida (19), Pennsylvania and Virginia (16 each), New Mexico (15), Colorado (14), and North Carolina (12). Those plants in West Virginia, Virginia, and Pennsylvania were principally processors of coal; those in Arizona, copper and copper-molybdenum ores; those in Florida, phosphate rock; those in New Mexico, copper and other base metal ores; and those in North Carolina, feldspar, mica, quartz, and spodumene.

Changes in Types of Material Treated.—To help detect any changes that occur in the types of material treated, kinds and quantities of product recovered, and reagents consumed, data were compiled by classifying materials with similar characteristics into one of four groups. The groups consist of sulfide ores, metallic oxides and carbonates, nonmetallic ores, and solid mineral fuels. Data were also compiled in greater detail for selected individual mineral commodities.

Sulfide Ores.—The principal sulfide ores treated by flotation were those of copper and copper-molybdenum. In 1975, these ores accounted for 85% of the total ores treated in sulfide flotation plants.

Although the number of flotation plants treating sulfide ores ranged from 95 in 1960, 108 in 1965, 105 in 1970, and 86 in 1975, the total daily capacity of the plants rose 81% from 1960 to 1975. The quantity of sulfide ores treated by flotation increased 79% during this period. However, production of sulfide flotation concentrates increased only 26% because of lower grade ores treated.

Sulfide ore represented 66% of the total ore treated by flotation in 1975, compared with 71% in 1970, 72% in 1965, and 78% in 1960. Also, sulfide concentrate produced represented 12% of total flotation concentrate recovered in 1975, compared with 16% in 1970, 19% in 1965, and 27% in 1960. Although the quantity of sulfide ore treated by flotation continued to gain, the flotation of nonsulfide materials have registered an even higher growth rate during 1960–75.

Because of the continued decline in grade of copper-bearing ores, the ratio of concentration of sulfide ores has shown a steady increase, rising from 26.5 to 1 in 1960, to 27.8 to 1 in 1965, to 31.8 to 1 in 1970, and to 37.6 to 1 in 1975. Average flotation reagent consumption per ton of ore treated rose slightly from 3.5 pounds in 1960 to 4.3 pounds in 1975.

Metal Oxides and Carbonates.—Flotation of iron oxide minerals dominates the flotation operations for this group of minerals which also includes ilmenite, limestone, and tungsten. For example, in 1975, iron oxide ore represented nearly 95% of the total ore treated, and accounted for over 95% of the total concentrates produced by flotation of metal oxides and carbonates.

The number of flotation plants (13) in 1975 was the same as in 1960. However, because of expansions in iron ore flotation, the total daily capacity of the plants rose from 14,000 tons in 1960 to 90,000 tons in 1975. Concurrently, the quantity of ore treated increased more than 10 times—from about 2.9 million tons in 1960 to 30.1 million tons in 1975—and concentrate production increased from less than 1 million tons in 1960 to more than 15 million tons in 1975.

Metal oxides and carbonate ores represented 7% of the total ores treated by flotation in 1975, compared with about 6% in each of 1970 and 1965, and slightly over 1% in 1960. Concentrate recovered accounted for 26% of total concentrates produced in 1975, compared with 24% in 1970, 18% in 1965, and 4% in 1960.

In 1970 and 1975, the material treated included magnetic iron concentrates that were upgraded by flotation; hence the drop in ratio of concentration from 3.0 to 1 in 1960 to 1.7 to 1 in 1970. On the other hand, the rise in ratio of concentration from 1.7 to 1 in 1970 to 1.9 to 1 in 1975 probably was due to the installation of a new large flotation plant in 1974 for treating nonmagnetic iron ores.

Although average reagent consumption per ton of ore treated was abnormally high in 1960, primarily because of two flotation plants that later ceased operations, average reagent consumption per ton of ore treated showed only minor fluctuations between 2.6 pounds in 1965, 2.2 pounds in 1970, and 2.8 pounds in 1975.

Nonmetallic Ores.—The number of flotation plants treating nonmetallic ores increased about 36% from 55 in 1960 to 75 in 1975. At the same time, the total daily capacity more than tripled, and the quantity of ore treated and concentrates produced each rose nearly threefold.

Phosphate continued as the leader in nonmetallic ore flotation and, in 1975, accounted for 74% of the nonmetallic ore treated by flotation and for 62% of the nonmetallic flotation concentrate produced. Significant quantities of potash, glass sand, and feldspar were also processed by flotation.

The quantity of nonmetallic ore treated by flotation represented 24% of the total ore treated by flotation in 1975, compared with 20% in 1970, 19% in 1965, and 18% in 1960. Nonmetallic mineral concentrate produced was 48% of total concentrate recovered in 1975, compared with 44% in 1970, 45% in 1965, and 55% in 1960.

Average reagent consumption per ton of ore treated totaled 4.7 pounds in 1975, compared with 8.7 pounds in 1970, 5.1 pounds in 1965, and 7.3 pounds in 1960.

Solid Mineral Fuels.—As a result of the rapid growth in flotation of bituminous coal, the number of flotation plants treating solid mineral fuels rose from 31 in 1960 to 78 in 1975. During the period the number of anthracite flotation plants decreased by 40% whereas the number of bituminous coal flotation plants nearly tripled. Corresponding increases of approximately threefold occurred in the total daily capacity, in the quantity of material treated, and in the production of clean coal.

Solid mineral fuels accounted for 3% of the total material treated by flotation in 1975, the same as in 1970 and 1965 but 1% higher than in 1960. Clean coal produced in 1975 represented 14% of the total material recovered by flotation, compared with 16% in 1970, 18% in 1965, and 13% in 1960.

Decreased usage of modifiers, collectors, and flocculants at solid mineral fuels flotation plants caused the average consumption of flotation reagents per ton of material treated to fall to 0.7 pound in 1975, compared with 1.2 pounds in 1970, 0.9 pound in 1965, and 2.6 pounds in 1960.

Copper.—One of the outstanding features of domestic copper flotation operations during 1960–75 was the impressive growth in both the productive capacity and the quantity of ore treated each year. Although the number of flotation plants (18) operating in 1975 was the same as in 1960, the total rated daily capacity more than doubled, rising from 158,000 tons in 1960 to 323,000 tons in 1975. The quantity of copper ore concentrated also more than doubled, increasing from 44 million tons in 1960 to 92 million tons in 1975.

The production of copper concentrate increased at a slower rate and rose only about 40% during 1960–75. The persistent drop in average grade of ore treated, from 0.92% copper in 1960 to 0.75% in 1975, more than offset improvements in processing procedures and reagent effectiveness.

The average consumption of flotation reagents per ton of copper ore treated rose from 2.5 pounds in 1960 to 8.2 pounds in 1970 and then dropped to 6.5 pounds in 1975, and the cost of the reagents per ton of ore increased from $0.06 in 1960 to $0.16 in 1975.

The location of copper flotation plants in 1975 was similar to that of preceding years with eight in Arizona, four in New Mexico, three in Nevada, two in Montana, and one in Michigan.

Copper–Molybdenum. — Although the number of flotation plants concentrating copper-molybdenum ore rose 50%—from 10 in 1960 to 15 in 1975—the rated daily capacity of the plants increased almost 100%, from 263,000 tons in 1960 to 514,000 tons in 1975. The 145 million tons of copper-molybdenum ore concentrated in 1975 was about 7% less than that treated in 1970 but exceeded that treated in 1960 by 53%.

Despite a relatively steady average copper recovery of 84% during 1960–75, the drop in average copper content of the ore from 0.69% in 1960 to 0.53% in 1975 limited the growth in output of copper concentrate to about 20% during the interval. Conversely, output of molybdenum concentrate increased about 80% from nearly 17,000 tons in 1960 to more than 30,000 tons in 1975.

The average consumption of flotation reagents per ton of ore treated declined from 4.5 pounds in 1960 to 3.5 pounds in 1975. At the same time the average cost of reagents per ton of ore treated rose from $0.06 to $0.11.

As in other years, the flotation plants that treated copper-molybdenum ores in 1975 were located in only 4 States, with 11 in Arizona, 2 in Utah, 1 in Nevada, and 1 in New Mexico.

Copper-Lead-Zinc. — The predominant feature of copper-lead-zinc ore flotation during 1960–75 was the enormous growth in lead concentrate production. Despite a decrease in number of flotation plants from 19 in 1960 to 13 in 1975 and only a minor increase in total plant capacity from 26,000 tons per day in 1960 to 29,000 tons per day in 1975, output of lead concentrate jumped from 103,000 tons in 1960 to 409,000 tons in 1975.

An increase in average grade of ore treated from 2.07% lead in 1960 to 4.91% lead in 1975 and a 30% increase in annual quantity of ore treated, were the principal factors contributing to the growth in lead concentrate production.

Concurrently, the average grade of copper in the ore treated declined from 0.98% to 0.29% and that of zinc dropped slightly from 1.08% in 1960 to 0.99% in 1975. As a result, output of copper concentrate in 1975 was about 25% that of 1960, whereas production of zinc concentrate in 1975 was about three times that of 1960.

With minor fluctuations, consumption of flotation reagents rose from 1.7 pounds per ton of ore in 1960 to 2.1 pounds per ton in 1975. Flotation reagents costs, however, increased steadily, from $0.10 per ton in 1960 to $0.25 per ton in 1975.

The location of flotation plants in 1975 was little changed from previous years with five in Missouri, three in Colorado, three in Idaho, one in Maine, and one in New Mexico.

Copper-Zinc-Iron Sulfide. — Virtually every component of copper-zinc-iron sulfide ore flotation declined from 1960 to 1975. The number of flotation plants decreased from eight in 1960 to three in 1975, with a drop in total daily capacity from 10,000 tons to 8,500 tons. Ore treated increased from 2.4 million tons in 1960 to 3.3 million tons in 1965 and then fell to 2.0 million tons in 1975.

With relatively minor fluctuations, the production of concentrates also dropped during 1960–75. Output of copper concentrate decreased from 91,000 tons in 1960 to 84,000 tons in 1975, zinc concentrate output went from 46,000 tons to 28,000 tons, and iron sulfide concentrate production fell from 863,000 tons in 1960 to 698,000 tons in 1975.

From 1960 to 1975, the average grade of ore treated declined from 1.03% to 0.91% for copper, declined from 41.20% to 31.90% for iron sulfide, and except for small variations in 1965 and 1970 was unchanged for zinc at 1.42%.

Gains were registered both in quantity and value of reagents per ton of ore. Reagent consumption rose from 8.5 pounds per ton of ore in 1960 to 14.7 pounds per ton of ore in 1975. At the same time the value of reagents per ton of ore rose from $0.18 to $0.60.

In 1975, one each of the copper-zinc-iron sulfide flotation plants was located in Arizona, Pennsylvania, and Tennessee.

Gold-Silver.—The magnitude of gold-silver ore flotation remained relatively small with a general downward trend from 1960 to 1975. The number of plants decreased from four in 1960 to three in 1975, and total daily capacity fell 48% from 1,600 tons per day to 890 tons per day. Similarly, the quantity of ore treated also decreased 50%, from 132,000 tons in 1960 to 66,000 tons in 1975.

The general decline in average grade of ore from 0.99 ounce of gold and 4.33 ounces of silver per ton in 1960 to 0.40 ounce of gold and 2.40 ounces of silver per ton in 1975 resulted in a decrease in concentrate production from 3,360 tons in 1960 to 476 tons in 1975.

Average consumption of flotation reagents varied slightly from 0.40 pound per ton of ore in 1960 to 0.46 pound per ton of ore in 1975, but average cost of reagents per ton of ore increased from $0.14 in 1960 to $0.35 in 1975.

In 1975, there was one gold-silver flotation plant each in California, Colorado, and Washington.

Lead-Zinc.—The flotation of lead-zinc ores registered remarkable gains from 1960 to 1975. Despite a drop in number of plants from 28 to 21 and a decrease in total daily capacity from 39,000 to 31,000 tons, the quantity of lead-zinc ore treated by flotation rose from 6.0 million tons in 1960 to 7.5 million tons in 1975.

The average lead content of the ore trended upward from 2.37% in 1960 to 4.78% in 1975, whereas that of zinc declined from 4.81% to 4.06%. Consequently, lead concentrate production increased steadily from 200,000 tons in 1960 to 476,000 tons in 1975, and zinc concentrate output rose at a slower rate from 460,000 tons in 1960 to 477,000 tons in 1975.

Average consumption of flotation reagents remained fairly stable—2.6 pounds per ton of ore in 1960 compared with 2.7 pounds per ton in 1975. However, the average cost of reagents per ton of ore increased from $0.21 in 1960 to $0.50 in 1975.

The location of the lead-zinc flotation plants in 1975 was similar to that of previous years with six in Colorado, five in Idaho, two in Missouri, two in Utah, and one each in Arizona, California, New Mexico, New York, Virginia, and Washington.

Zinc.—Although the number of zinc flotation plants fluctuated between 7 in 1960 and 10 in 1975, the productive capacity of the plants increased steadily from 14,000 tons per day in 1960 to nearly 20,000 tons per day in 1975.

The quantity of zinc ore concentrated by flotation trended upward from 2.6 million tons in 1960 to nearly 3.8 million tons in 1970 but dropped to 3.1 million tons in 1975. Even though the average recovery of zinc in concentrate remained relatively constant at about 93%, the decrease in average grade of ore from 5.91% zinc in 1960 to 4.38% zinc in 1975 caused the output of zinc concentrate to drop from 233,000 tons in 1960 to about 212,000 tons in 1975.

Despite a continual decrease in average consumption of flotation reagents per ton of ore treated, from 1.1 pounds in 1960 to 0.8 pound in 1975, the average cost of reagents per ton of ore increased from $0.13 to $0.18 during the 1960–75 period.

In 1975, the location of the zinc flotation plants was similar to that of the preceding years with six in Tennessee, two in Wisconsin, and one each in New York and Pennsylvania.

Fluorspar.—All phases of fluorspar ore flotation trended downward between 1960 and 1975. The number of flotation plants in 1960 decreased 50% to three in 1975, the total daily capacity of the plants was reduced by one-third to 1,400 tons, and the quantity of ore treated decreased more than 40% to 275,000 tons in 1975.

At the same time, the production of fluorspar concentrate and byproduct lead and zinc concentrates each fell about 50% from 1960 to 75,000 tons of fluorspar, 1,500 tons of lead, and 9,000 tons of zinc in 1975. Average grade of ore declined from 41% fluorspar in 1960 to 38% in 1975.

During the 1960–75 period, the average consumption of flotation reagents per ton of ore nearly tripled, from 7.0 pounds in 1960 to 19.4 pounds in 1975, as did the average cost per ton, which rose from $0.75 to $2.07.

Illinois with two flotation plants and Kentucky with one plant were the sole fluorspar producers in 1975.

Feldspar, Mica, Quartz, and Spodumene.—Significant gains were recorded in the flotation of this group of minerals in 1960–75. The number of flotation plants increased 30% to 13 in 1975, the total daily capacity of the plants nearly doubled to 10,400 tons in 1975, and the quantity of ore treated more than doubled, from 1.0 million tons in 1960 to 2.6 million tons in 1975.

Notable corresponding gains were also registered in production of concentrates. From 1960 to 1975, feldspar concentrate output rose from 276,000 tons to 531,000 ons, mica concentrate output went from 24,000 to 93,000 tons, quartz concentrate production increased from about 70,000 tons to 295,000 tons, and output of other oncentrates, mainly spodumene, rose from 17,000 tons to 218,000 tons.

Flotation reagent consumption per ton of ore declined from 9.2 pounds in 1960 to 3.3 pounds in 1975, and contrary to other flotation operations, reagent costs per ton of ore also declined from $0.67 in 1960 to $0.58 in 1975.

North Carolina with nine flotation plants continued as the leading State, followed by Alabama, Connecticut, Georgia, and Ohio with one plant each.

Glass Sand.—The large growth reported in glass sand flotation between 1960 and 1975 was probably due in part to more complete coverage of the industry by the Bureau of Mines flotation survey. However, it is noteworthy that the number of plants increased from 5 in 1960 to 22 in 1975. Equally striking was the growth in total daily plant capacity from 3,000 tons in 1960 to 40,000 tons in 1975, the rise in quantity of material treated from 800,000 tons in 1960 to about 7.4 million tons in 1975, and the increase in production of clean sand from 735,000 tons in 1960 to almost 6.1 million tons in 1975.

Flotation reagent consumption averaged 2.2 pounds per ton of material treated in 1975—down slightly from 2.4 pounds per ton in 1960. Average reagent costs of $0.21 per ton of material treated in 1960 remained relatively constant until 1975, when they rose to $0.34 per ton.

In 1975, the glass sand flotation plants were located in several States as follows: California four, Florida two, Georgia one, Idaho one, Louisiana one, Michigan two, New Jersey three, North Carolina one, Oklahoma one, Pennsylvania two, South Carolina one, Tennessee two, and West Virginia one.

Iron Ore.—Of all the flotation operations, the greatest advancement and growth occurred in the flotation of iron ore during 1960–75. A leading contributor to that advancement and growth was the Bureau of Mines, which, in cooperation with industry, pioneered and developed a flotation procedure for efficiently concentrating nonmagnetic iron ores. A plant using the Bureau process was placed in operation in 1974.

Although the number of flotation plants treating iron ore increased only from four in 1960 to five in 1975, Bureau developments and other improvements in iron ore flotation caused total daily capacity of the plants to increase from 6,000 tons in 1960 to 83,000 tons in 1975.

The quantity of ore treated and the quantity of concentrate produced each year showed similar and rapid growth. For example, ore treated rose from 1.5 million tons in 1960 to 28.6 million tons in 1975. Concurrently, concentrate output jumped from about 600,000 tons in 1960 to nearly 15 million tons in 1975. In 1970 and 1975, the ore treated included magnetic concentrate that was upgraded by flotation.

The average consumption of flotation reagents per ton of ore treated fell from 5.3 pounds in 1960 to 2.6 pounds in 1975, whereas the corresponding costs of reagents rose from $0.28 in 1960 to $0.38 in 1975.

In 1975, four iron ore flotation plants were in Michigan; the other plant was in Missouri.

Limestone-Magnesite. — The seemingly erratic behavior of the domestic limestone-magnesite flotation operations between 1960 and 1975 may have resulted from inadequate coverage in conducting surveys of the operations. The number of flotation plants ranged from three in 1960 to five in 1975. During the interval, total daily plant capacity rose from 1,000 tons in 1960 to 4,600 tons in 1970 and then dropped to 2,000 tons in 1975. Material treated in the flotation plants increased from 218,000 in 1960 to 1.1 million tons in 1970 and subsequently decreased to 402,000 tons in 1975.

Concentrate production followed a similar pattern, rising from 105,000 tons in 1960 to 864,000 tons in 1970 and falling to 341,000 tons in 1975. Average flotation reagent consumption per ton of material treated showed a relatively general increase from 2.8 pounds in 1960 to 5.1 pounds in 1975. Average cost of flotation reagents per ton of material treated rose with minor fluctuations from $0.35 in 1960 to $0.74 in 1975.

Two of the five limestone-magnesite flotation plants operating in 1975 were in Vermont, and Maryland, Nevada, and Texas had one each.

Phosphate.—The flotation of phosphate ores registered remarkable growth during 1960–75. Although the number of flotation plants for treating phosphate ores increased from 15 in 1960 to 19 in 1975, the total daily plant capacity increased fourfold, rising from 89,000 tons in 1960 to 356,000 tons in 1975, and quantity of material treated increased nearly fourfold from 21 million tons in 1960 to 75 million tons in 1975.

Because of a decline in average grade of material treated from 13.8% P_2O_5 in 1960 to 11.6% P_2O_5 in 1975, the growth in flotation concentrate production lagged behind that of the material treated and rose nearly threefold—from 7.0 million tons in 1960 to 18.4 million tons in 1975.

Flotation reagent consumption varied widely and ranged from 11.1 pounds per ton of material treated in 1960 to 5.6 pounds per ton of material treated in 1975. Flotation reagent cost per ton of material treated also fluctuated, but to a lesser degree, and rose from $0.20 in 1960 to $0.33 in 1975.

In 1975, most of the phosphate flotation plants (17) were in Florida with one each in North Carolina and Utah.

Potash.—Flotation of potash ores showed minor but important growth between 1960 and 1975. In 1960, there were seven flotation plants with a total daily capacity of 40,000 tons, compared with eight plants with a total daily capacity of 49,000 tons in 1975. Fluctuations in the annual quantity of material treated were varied, however; the 13.9 million tons treated in 1975 exceeded that of 1960 by almost 2 million tons.

The declining average grade of ore from 18.5% K_2O in 1960 to 16.4% in 1975 retarded the growth in output of potash concentrate, which rose from 3.1 million tons in 1960 to only 3.4 million tons in 1975.

Flotation reagent consumption per ton of material treated dropped slightly from 1.1 pounds in 1960 to 0.9 pounds in 1975. Conversely, the cost of reagents per ton of material treated rose slightly from $0.17 in 1960 to $0.20 in 1975.

In 1975, as in previous years, the flotation plants were located in only two States—six in New Mexico and two in Utah.

Anthracite and Bituminous Coal.—Only three anthracite flotation plants operated in 1975. Therefore, data on the operations have been combined with similar data on bituminous coal flotation to avoid disclosing confidential information of the anthracite processors. From 1960 to 1975, the number of anthracite flotation plants—all in Pennsylvania—dropped from five to three, and the total daily capacity of the plants, the annual quantity of material treated, and the annual production of clean anthracite produced each fell about 80%.

Conversely, during 1960–75, the number of bituminous coal flotation plants nearly tripled from 26 in 1960 to 75 in 1975. At the same time, the quantity of coal treated and the quantity of clean coal produced each rose almost fourfold.

Flotation reagent consumption per ton of bituminous coal treated fell with slight annual variations from 2.7 pounds in 1960 to 0.7 pound in 1975. However, average costs of reagents per ton of coal doubled, rising from $0.09 in 1960 to $0.18 in 1975.

West Virginia continued as the leader in bituminous coal flotation plants in 1975 with 33 plants, followed by Virginia 13, Pennsylvania 9, Alabama 5, Illinois and Kentucky, 4 each, Colorado 3, Utah 2, and Indiana and New Mexico 1 each.

Miscellaneous.—Data from some flotation operations are not shown separately to avoid disclosing company confidential information. Also, because of dissimilarity of data for various plants, it would be inappropriate to combine the data. However, the data have been included in the totals to present complete information on flotation in the minerals industry.

Flotation plants for which data have been handled in this manner included the following:

Commodity	Number and State
Barite	**1 in Arkansas.**
Do	**2 in Georgia.**

Statistical Summary

By Staff, Office of Technical Data Services

This chapter summarizes data on crude mineral production for the United States, its island possessions, and the Commonwealth of Puerto Rico. Included also are tables that show the principal mineral commodities exported from and imported into the United States, and that compare world and U.S. mineral production. The detailed data from which these tables were derived are contained in the individual commodity chapters of volume I and in the State chapters of volume II of this edition of the Minerals Yearbook.

Although crude mineral production may be measured at any of several stages of extraction and processing, the stage of measurement used in this chapter is what is normally termed "mine output." It usually refers to minerals or ores in the form in which they are first extracted from the ground, but customarily includes the product of auxiliary processing at or near the mines.

Because of inadequacies in the statistics available, some series deviate from the foregoing definition. In the cases of gold, silver, copper, lead, zinc, and tin, the quantities are recorded on a mine basis (as the recoverable content of ore sold or treated). However, the values assigned to these quantities are based on the average selling price of refined metal, not on the mine value. Mercury is measured as recovered metal and valued at the average New York price for the metal.

The weight or volume units shown are those customarily used in the particular industries producing the commodities. Values shown are in current dollars, with no adjustment made to compensate for changes in the purchasing power of the dollar.

Table 1.—Value of crude mineral production [1] in the United States, by mineral group

(Million dollars)

Year	Mineral fuels	Nonmetals (except fuels)	Metals	Total
1971	21,247	6,058	3,406	30,711

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).

[2] Includes a small quantity of anthracite mined in States other than Pennsylvania.

[3] Grindstones, pulpstones, grinding pebbles, sharpening stones, and tube mill liners.

[4] Excludes abrasive stone, bituminous limestone, bituminous sandstone, and soapstone, all included elsewhere in table.

Table 3.—Minerals produced in the United States and principal producing States in 1975

Mineral	Principal producing States, in order of quantity	Other producing States
Antimony ore and concentrate	Idaho and Mont.	
Aplite	Va.	
Asbestos	Calif., Vt., Ariz., N.C.	
Asphalt (native)	Tex., Utah, Ala., Mo.	
Barite	Nev., Mo., Ark., Ga	Alaska, Calif., Idaho, Ill., Mont., Tenn.
Bauxite	Ark., Ala., Ga.	
Beryllium concentrate	Utah	S. Dak.
Boron minerals	Calif.	
Bromine	Ark., Mich., Calif.	
Calcium-magnesium chloride	Mich. and Calif.	
Carbon dioxide (natural)	N. Mex., Colo., Calif., Utah.	
Cement	Tex., Calif., Pa., Mich	Ala., Ariz., Ark., Colo., Fla., Ga., Hawaii, Idaho, Ill., Ind., Iowa, Kans., Ky., La., Maine, Md., Minn., Miss., Mo., Mont., Nebr., Nev., N. Mex., N.Y., N.C., Ohio, Okla., Oreg., S.C., S. Dak., Tenn., Utah, Va., Wash., W. Va., Wis., Wyo.
Clays	Ga., Tex., Ohio, N.C	All other States except Alaska, R.I., Vt.
Coal	Ky., W. Va., Pa., Ill	Ala., Alaska, Ariz., Ark., Colo., Ga., Ind., Iowa, Kans., Md., Mo., Mont., N. Mex., N. Dak., Ohio, Okla., Tenn., Tex., Utah, Va., Wash., Wyo.
Copper (mine)	Ariz., Utah, N. Mex., Mont	Calif., Colo., Idaho, Maine, Mich., Mo., Nev., Okla., Oreg., Tenn., Wash., Wis.
Diatomite	Calif., Nev., Wash	Kans. and Oreg.
Emery	N.Y. and Oreg.	
Feldspar	N.C., Conn., Calif., Ga	Ariz., Colo., S. Dak., Wyo.
Fluorspar	Ill., Utah, Tex., Mont	Ky., Nev., N. Mex.
Garnet, abrasive	Idaho and N.Y.	
Gold (mine)	Nev., S. Dak., Utah, Ariz	Alaska, Calif., Colo., Idaho, Mont., N. Mex., Oreg., Tenn., Wash.
Graphite	Tex.	
Gypsum	Calif., Mich., Iowa, Tex	Ariz., Ark., Colo., Idaho, Ind., Kans., La., Mont., Nev., N. Mex., N.Y., Ohio, Okla., S. Dak., Utah, Va., Wash., Wyo.
Helium	Kans., Okla., Tex., Ariz	N. Mex.
Iodine	Mich.	
Iron ore	Minn., Mich., Calif., Mo	Ala., Ariz., Ark., Colo., Ga., Idaho, Mont., Nev., N. Mex., N.Y., Pa., S. Dak., Tex., Utah, Wis., Wyo.
Kyanite	Va. and Ga.	
Lead (mine)	Mo., Idaho, Colo., Utah	Ariz., Calif., Ill., Ky., Maine, Mont., Nev., N. Mex., N.Y., Oreg., Va., Wash., Wis.
Lime	Ohio, Pa., Tex., Mo	Ala., Ariz., Ark., Calif., Colo., Conn., Fla., Hawaii, Idaho, Ill., Ind., Iowa, Kans., Ky., La., Md., Mass., Mich., Minn., Miss., Mont., Nebr., Nev., N. Mex., N.Y., N. Dak., Okla., Oreg., S. Dak., Tenn., Utah, Va., Wash., W. Va., Wis., Wyo.
Lithium minerals	N.C., Nev., Calif.	
Magnesite	Nev.	
Magnesium chloride	Tex.	
Magnesium compounds	Mich., Calif., N.J., Fla	Del., Miss., Tex., Utah.
Manganiferous ore	Minn. and N. Mex.	
Manganiferous residuum	N.J.	
Marl, greensand	N.J.	
Mercury	Nev., Calif., N.Y.	
Mica, scrap	N.C., Ala., N. Mex., Ga	Ariz., Conn., Pa., S.C., S. Dak.
Molybdenum	Colo., Ariz., N. Mex., Utah	Calif. and Nev.
Natural gas	Tex., La., Okla., N. Mex	Ala., Alaska, Ariz., Ark., Calif., Colo., Fla., Ill., Ind., Kans., Ky., Md., Mich., Miss., Mo., Mont., Nebr., N.Y., N. Dak., Ohio, Pa., Tenn., Utah, Va., W. Va., Wyo.

Table 3.—Minerals produced in the United States and principal producing States in 1975—Continued

Mineral	Principal producing States, in order of quantity	Other producing States
Natural gas liquids	Tex., La., Okla., N. Mex	Ala., Alaska, Ark., Calif., Colo., Fla., Ill., Kans., Ky., Mich., Miss., Mont., Nebr., N. Dak., Pa., S. Dak., Utah, W. Va., Wyo.
Nickel	Oreg.	
Olivine	N.C. and Wash.	
Peat	Mich., Fla., Ill., Ind	Calif., Colo., Ga., Iowa, Maine, Md., Mass., Minn., Mont., N.J., N.Y., N. Dak., Ohio, Pa., S.C., Vt., Wash., Wis.
Perlite	N. Mex., Ariz., Calif., Colo	Idaho and Nev.
Petroleum, crude	Tex., La., Calif., Okla	Ala., Alaska, Ariz., Ark., Colo., Fla., Ill., Ind., Kans., Ky., Mich., Miss., Mo., Mont., Nebr., Nev., N. Mex., N.Y., N. Dak., Ohio, Pa., S. Dak., Tenn., Utah, Va., W. Va., Wyo.
Phosphate rock	Fla., Idaho, Tenn., N.C	Ark., Mo., Mont., Utah, Wyo.
Platinum-group metals	Alaska.	
Potassium salts	N. Mex., Utah, Calif.	
Pumice	Oreg., Ariz., N. Mex., Nev	Calif., Colo., Hawaii, Idaho, Kans., Okla., Utah.
Pyrites ore and concentrate	Tenn., Colo., Ariz.	
Rare-earth metal concentrate	Calif. and Fla.	
Salt	La., Tex., N.Y., Ohio	Ala., Ariz., Calif., Colo., Kans., Mich., Nev., N. Mex., N. Dak., Okla., Utah, W. Va.
Sand and gravel	Calif., Alaska, Mich., Ill., Tex	All other States.
Silver (mine)	Idaho, Ariz., Colo., Utah	Alaska, Calif., Ill., Maine, Mich., Mo., Mont., Nev., N. Mex., N.Y., Okla., Oreg., S. Dak., Tenn., Va., Wash., Wis.
Sodium carbonate (natural)	Wyo. and Calif.	
Sodium sulfate (natural)	Calif., Tex., Utah.	
Staurolite	Fla.	
Stone	Ill., Pa., Tex., Mo	All other States except Del.
Sulfur (Frasch)	Tex. and La.	
Talc, soapstone, pyrophyllite	Vt., N.Y., Calif., Tex	Ala., Ark., Ga., Mont., Nev., N.C., Oreg., Va., Wash.
Tin	Colo., N. Mex., Alaska.	
Titanium concentrate	N.Y., Fla., N.J.	
Tripoli	Ill., Okla., Ark., Pa.	
Tungsten concentrate	Calif., Colo., Nev	Ariz., Idaho, Mont., Utah, Wash.
Uranium	N. Mex., Wyo., Colo., Utah	Tex. and Wash.
Vanadium	Ark., Colo., Idaho, Utah	N. Mex.
Vermiculite	Mont. and S.C.	
Wollastonite	N.Y.	
Zinc (mine)	Tenn., N.Y., Mo., Colo	Ariz., Calif., Idaho, Ill., Ky., Maine, Mont., Nev., N.J., N. Mex., Pa., Utah, Va., Wash., Wis.
Zircon concentrate	Fla.	

Table 4.—Value of mineral production in the United States and principal minerals produced in 1975

State	Value (thousands)	Rank	Percent of U.S. total	Principal minerals, in order of value
Alabama	$968,973	18	1.56	Coal, petroleum, cement, stone.
Alaska	480,745	24	.77	Petroleum, natural gas, stone, sand and gravel.
Arizona	1,288,423	14	2.07	Copper, molybdenum, cement, sand and gravel.
Arkansas	436,441	25	.70	Petroleum, bromine, natural gas, stone.
California	3,152,937	4	5.06	Petroleum, cement, natural gas, sand and gravel.
Colorado	960,800	20	1.54	Petroleum, molybdenum, coal, cement.
Connecticut	33,010	46	.05	Stone, sand and gravel, feldspar, lime.
Delaware	[1] 1,906	50	([2])	Sand and gravel, magnesium compounds, clays, gem stones.
Florida	1,775,500	9	2.85	Phosphate rock, petroleum, stone, cement.
Georgia	333,387	29	.54	Clays, stone, cement, sand and gravel.
Hawaii	49,710	44	.08	Stone, cement, sand and gravel, pumice.
Idaho	238,788	31	.38	Phosphate rock, silver, zinc, lead.
Illinois	1,490,598	11	2.39	Coal, petroleum, stone, sand and gravel.
Indiana	541,600	23	.87	Coal, cement, stone, petroleum.
Iowa	195,740	33	.31	Cement, stone, sand and gravel, coal.
Kansas	970,611	17	1.56	Petroleum, natural gas, natural gas liquids, cement.
Kentucky	2,738,859	6	4.40	Coal, petroleum, stone, natural gas.
Louisiana	8,513,275	2	13.67	Petroleum, natural gas, natural gas liquids, sulfur.
Maine	36,741	45	.06	Cement, sand and gravel, zinc, stone.
Maryland	164,919	34	.26	Coal, stone, cement, sand and gravel.
Massachusetts	58,846	43	.09	Stone, sand and gravel, lime, clays.
Michigan	1,291,653	13	2.07	Iron ore, petroleum, cement, copper.
Minnesota	1,097,088	16	1.76	Iron ore, sand and gravel, stone, cement.
Mississippi	410,009	27	.66	Petroleum, natural gas, sand and gravel, cement.
Missouri	722,728	21	1.16	Lead, cement, stone, iron ore.
Montana	573,150	22	.92	Petroleum, copper, coal, cement.
Nebraska	111,905	40	.18	Petroleum, cement, sand and gravel, stone.
Nevada	258,390	30	.41	Copper, gold, sand and gravel, cement.
New Hampshire	17,107	48	.03	Sand and gravel, stone, clays, gem stones.
New Jersey	123,702	38	.20	Stone, sand and gravel, zinc, titanium concentrate.
New Mexico	2,091.541	8	3.36	Petroleum, natural gas, copper, potassium salts.
New York	397,728	28	.64	Cement, stone, zinc, salt.
North Carolina	152,880	36	.25	Stone, phosphate rock, lithium minerals, sand and gravel.
North Dakota	201,504	32	.32	Petroleum, coal, sand and gravel, natural gas liquids.
Ohio	1,356,454	12	2.18	Coal, petroleum, stone, lime.
Oklahoma	2,267,095	7	3.64	Petroleum, natural gas, natural gas liquids, coal.
Oregon	106,004	41	.17	Stone, sand and gravel, cement, nickel.
Pennsylvania	2,907,838	5	4.67	Coal, cement, stone, lime.
Rhode Island	6,198	49	.01	Sand and gravel, stone, gem stones.
South Carolina	115,467	39	.19	Cement, stone, sand and gravel, clays.
South Dakota	101,821	42	.16	Gold, cement, stone, sand and gravel.
Tennessee	424,768	26	.68	Coal, stone, zinc, cement.
Texas	15,529,931	1	24.94	Petroleum, natural gas, natural gas liquids, cement.
Utah	966,407	19	1.55	Petroleum, copper, coal, gold.
Vermont	28,779	47	.05	Stone, asbestos, sand and gravel, talc.
Virginia	1,261,974	15	2.03	Coal, stone, cement, sand and gravel.
Washington	158.505	35	.25	Cement, coal, sand and gravel, stone.
West Virginia	3,390,212	3	5.44	Coal, natural gas, petroleum, natural gas liquids.
Wisconsin	132,260	37	.21	Sand and gravel, stone, iron ore, cement.
Wyoming	1,644,438	10	2.64	Petroleum, sodium compounds, coal, natural gas.
Total	62,275,000	--	100.00	

[1] Incomplete total.
[2] Less than ½ unit.

Ore and concentrates:				
Exports ..... thousand short tons..	18	1,430	139	6,896
Reexports ..... do....	99	3,101	45	2,111
Ferrochrome ..... do....	7	3,765	13	9,075
Cobalt ..... thousand pounds..	3,679	10,979	4,237	14,881
Columbium metals, alloys, other forms ..... do....	33	563	58	787
Copper:				
Ore, concentrate, composition metal and unrefined (copper content) ..... short tons..	[r] 23,381	28,819	16,451	14,454
Scrap ..... do....	41,342	46,413	45,002	40,793
Refined copper and semimanufactures ..... do....	202,203	448,584	258,165	465,553
Other copper manufactures ..... do....	8,332	17,583	9,518	14,158
Copper sulfate or blue vitriol ..... do....	1,815	2,138	1,248	2,067
Copper-base alloys ..... do....	169,521	284,839	130,254	179,838
Ferroalloys:				
Ferrosilicon ..... do....	6,575	3,338	39,712	15,732
Ferrophosphorus ..... do....	3,677	408	437	57
Gold:				
Ore and base bullion ..... troy ounces..	308,081	49,410	393,970	63,654
Bullion, refined ..... do....	3,555,193	179,070	3,101,812	429,278
Iron ore ..... thousand long tons..	2,323	35,148	2,537	60,071
Iron and steel:				
Pig iron ..... short tons..	100,582	6,743	59,596	4,636
Iron and steel products (major):				
Semimanufactures ..... do....	[r] 4,757,829	1,373,496	1,690,956	633,502
Manufactured steel mill products ..... do....	[r] 2,234,200	[r] 1,638,541	2,284,043	2,336,341
Iron and steep scrap: Ferrous scrap, including rerolling materials ..... thousand short tons..	9,023	881,885	9,642	780,984
Slag ..... short tons..	51,902	2,524	139,516	5,506
Lead:				
Pigs, bars, anodes, sheets, etc ..... do....	61,982	32,685	21,256	12,041
Scrap ..... do....	59,366	16,813	49,951	10,063
Magnesium, metal and alloys, scrap, semimanufactured forms ..... do....	46,398	48,511	32,591	48,191
Manganese:				
Ore and concentrate ..... do....	223,088	13,656	204,523	13,886
Ferromanganese ..... do....	7,011	2,204	32,800	10,601
Metal ..... do....	2,318	2,119	3,256	3,318
Mercury:				
Exports ..... 76-pound flasks..	466	270	339	152
Reexports ..... do....	--	--	155	68
Molybdenum:				
Ore and concentrates (molybdenum content) thousand pounds..	78,660	151,075	62,611	159,592
Metals and alloys, crude and scrap ..... do....	105	256	317	858
Wire ..... do....	415	4,210	270	2,863
Semifabricated forms, n.e.c ..... do....	251	1,670	312	1,790
Powder ..... do....	203	728	60	296
Ferromolybdenum ..... do....	4,094	7,094	2,241	4,798

See footnotes at end of table.

Table 9.—U.S. exports of principal minerals and products—Continued

Mineral	1974		1975	
	Quantity	Value (thousands)	Quantity	Value (thousands)
METALS—Continued				
Nickel:				
Alloys and scrap (including Monel metal), ingots, bars, sheets, etc ----- short tons----	22,355	$94,980	23,118	$102,400
Catalysts ---do----	3,477	9,143	3,536	13,713
Nickel-chrome electric resistance wire -do----	1,117	6,056	679	4,769
Semifabricated forms, n.e.c ---do----	3,493	23,319	2,788	20,420
Platinum:				
Ore, concentrate, metal and alloys in ingots, bars, sheets, anodes, and other forms, including scrap ---troy ounces--	474,494	78,142	376,450	56,412
Platinum-group metals:				
Palladium, rhodium, iridium, osmiridium, ruthenium, and osmium (metal and alloys including scrap) ---do----	361,260	39,279	283,435	31,102
Manufactures, except jewelry ---	NA	3,753	NA	3,246
Rare earths; cerium ore, metal, alloys, lighter flints ---pounds--	192,144	503	100,279	300
Silicon:				
Ferrosilicon ---short tons--	6,575	3,338	38,452	15,281
Silicon carbide, crude and in grains ---do----	r 13,612	5,813	12,970	6,839
Silver:				
Ore, concentrates, waste, sweepings thousand troy ounces--	12,699	53,956	10,005	43,481
Bullion, refined ---do----	5,691	27,695	22,621	104,086
Tantalum:				
Ore, metal, other forms ---thousand pounds--	704	6,813	531	5,545
Powder ---do----	233	7,008	161	5,974
Tin:				
Ingots, pigs, bars, etc.:				
Exports ---long tons--	5,908	47,774	1,421	10,457
Reexports ---do--	2,507	15,700	2,118	15,531
Tin scrap and other tin-bearing material except tinplate scrap ---do----	7,325	5,950	5,062	4,343
Titanium:				
Ore and concentrate ---short tons--	3,264	727	3,147	505
Sponge (including iodide titanium and scrap) do----	4,730	9,288	4,326	7,630
Intermediate mill shapes and mill products, n.e.c ---do----	1,719	19,600	1,900	24,726
Dioxide and pigments ---do----	[2] 30,379	[2] 24,575	15,807	12,110
Tungsten: Ore and concentrates (tungsten content):				
Exports ---thousand pounds--	1,187	4,835	1,316	8,082
Reexports ---do----	88	292	316	930
Uranium:				
Ores and concentrates (U_3O_8 content) pounds--	--	--	122,663	1,840
Metal ---do----	20,496	322	14,840	203
Compounds ---do----	4,682,926	30,855	3,837,266	52,040
Isotopes (stable) and their compounds ---	NA	2,786	NA	2,679
Radioactive materials ---thousand curies--	25,431,262	16,571	37,850,386	20,088
Special nuclear materials ---	NA	158,267	NA	236,849
Vanadium:				
Ore and concentrate, pentoxide, etc. (vanadium content) ---pounds--	406,235	1,327	430,592	1,628
Ferrovanadium ---do----	2,670,321	7,863	2,035,851	7,952
Zinc:				
Slabs, pigs, blocks ---short tons--	19,062	16,511	6,897	5,870
Sheets, plates, strips, other forms, n.e.c do----	3,487	3,842	1,629	2,086
Waste, scrap, and dust (zinc content) -do----	12,088	6,280	5,051	2,448
Semifabricated forms, n.e.c ---do----	28,456	27,343	14,196	9,379
Zirconium:				
Ore and concentrate ---pounds--	42,973,250	3,323	37,531,345	4,787
Metals, alloys, other forms ---do----	1,650,695	18,195	2,649,694	25,829
NONMETALS				
Abrasives:				
Dust and powder of precious or semiprecious stones (including diamond dust and powder) thousand carats--	14,005	34,822	12,802	32,088
Crushing bort ---do----	11	25	3	12
Industrial diamonds ---do----	981	5,460	950	5,948
Diamond grinding wheels ---do----	894	5,574	684	4,933
Other natural and artificial metallic abrasives and products ---	NA	69,627	NA	59,868

See footnotes at end of table.

Table 9.—U.S. exports of principal minerals and products—Continued

Mineral	1974		1975	
	Quantity	Value (thousands)	Quantity	Value (thousands)
NONMETALS—Continued				
Asbestos:				
Exports:				
Unmanufactured ... short tons	55,114	$8,643	34,921	$10,059
Products ... do	NA	60,256	NA	60,556
Reexports:				
Unmanufactured ... do	6,609	549	1,526	608
Products ... do	NA	140	NA	220
Barite:				
Natural barium sulfate ... do	61,245	2,518	57,386	1,868
Lithopone ... do	1,185	967	1,833	1,060
Boron, boric acid, borates (crude and refined) ... do	[r] 249,884	42,610	245,963	54,018
Cement ... do	289,844	14,860	494,132	28,409
Clays:				
Kaolin or china clay ... do	848,873	42,080	878,619	47,905
Fire clay ... do	224,110	5,983	219,431	7,191
Other clays ... do	1,376,888	66,148	1,216,088	65,202
Feldspar, leucite, nepheline and nepheline syenite ... thousand pounds	36,638	662	19,087	507
Fluorspar ... short tons	5,847	316	1,355	194
Gem stones:				
Diamond ... thousand carats	284	[r] 304,639	265	236,988
Pearls ...	NA	817	NA	413
Other ...	NA	[r] 19,627	NA	25,480
Graphite ... short tons	12,189	1,693	10,586	1,890
Gypsum:				
Crude (crushed or calcined) ... thousand short tons	132	3,910	75	4,505
Manufactures, n.e.c ...	NA	6,934	NA	5,976
Lithium hydroxide ... thousand pounds	1,198	1,118	1,226	1,593
Kyanite and allied minerals ... short tons	135,982	8,205	150,369	9,355
Lime ... do	31,639	1,516	53,853	2,746
Magnesium compounds:				
Magnesite and dead burned ... thousand pounds	102,533	7,749	165,309	14,146
Magnesite (crude, caustic calcined, lump or ground) ... do	21,465	5,088	18,195	4,538
Mica (sheet, waste and scrap and ground) ... pounds	16,842,858	3,085	10,977,353	3,154
Mica (manufactured) ... do	1,053,980	3,430	1,132,301	3,950
Mineral-earth pigments, iron oxide, natural and manufactured ... short tons	15,585	9,437	13,231	7,710
Nitrogen compounds (major) ... thousand short tons	[r] 3,757	[r] 566,533	4,684	841,710
Phosphate rock ... do	[r] 14,208	[r] 255,899	12,606	461,553
Phosphatic fertilizers:				
Superphosphates ... do	[r] 1,153	[r] 227,490	1,180	193,230
Ammonium phosphates ... do	1,992	358,807	2,422	532,274
Elemental phosphorus ... short tons	[r] 33,691	[r] 20,119	35,845	36,659
Mixed chemical fertilizer ... thousand short tons	474	53,476	324	40,695
Pigments and compounds (lead and zinc):				
Lead oxides:				
Pigment grade ... short tons	3,395	1,926	1,695	901
Other grade ... do	1,684	1,511	580	490
Zinc oxides:				
Pigment grade ... do	9,237	4,021	2,389	1,867
Other grade ... do	3,008	2,417	715	496
Zinc compounds ... do	1,185	967	917	1,060
Potash:				
Fertilizer ... do	1,414,598	66,175	1,419,317	[2] 92,701
Chemical ... do	38,290	14,712	104,497	18,949
Pumice and pumicite ... thousand pounds	5,821	1,211	2,504	1,027
Quartz (natural), quartzite, cryolite, chiolite ... short tons	3,002	808	1,767	1,106
Salt:				
Crude and refined ... thousand short tons	521	4,276	1,332	9,070
Shipments to noncontiguous territories ... do	19	1,793	20	2,304
Sand and gravel:				
Sand:				
Construction ... short tons	658,801	1,132	510,859	1,111
Industrial ... do	1,123,954	9,864	2,171,109	13,071
Gravel ... do	472,896	668	537,290	864

See footnotes at end of table.

Table 9.—U.S. exports of principal minerals and products—Continued

Mineral	1974		1975	
	Quantity	Value (thousands)	Quantity	Value (thousands)
NONMETALS—Continued				
Sodium and sodium compounds:				
Sodium sulfate ------------------short tons--	51	$3,250	77	$6,144
Sodium carbonate ---------------------do----	564	34,156	552	45,985
Stone:				
Dolomite (block) ---------------------do----	86	1,559	49	1,464
Limestone (crushed, ground, broken) --do----	2,793	7,753	3,386	9,993
Marble and other building and monumental --	NA	1,920	NA	2,449
Stone (crushed, ground, broken) thousand short tons--	625	4,850	896	5,843
Manufactures of stone ----------------------	NA	2,077	NA	2,376
Sulfur:				
Crude ------------------thousand long tons--	2,580	95,516	1,288	69,553
Crushed, ground, flowers of ------------do----	21	1,829	7	2,248
Talc (crude and ground) -------------short tons--	182,706	6,711	157,681	6,338
FUELS				
Carbon black ------------------thousand pounds--	201,737	32,947	87,947	15,474
Coal:				
Anthracite --------------thousand short tons--	735	16,577	640	25,801
Bituminous ----------------------------do----	59,926	2,420,334	65,669	3,232,893
Briquets ------------------------------do----	113	6,729	90	9,566
Coke ---------------------------------do----	1,278	43,564	1,273	74,732
Natural gas ----------------thousand cubic feet--	[r] 110,173,729	[r] 70,209	105,879,552	114,275
Petroleum:				
Crude --------------------thousand barrels--	1,072	13,565	19	187
Gasoline ------------------------------do----	655	12,105	185	3,103
Jet -----------------------------------do----	655	7,637	326	3,459
Naphtha -------------------------------do----	1,293	27,211	1,168	27,271
Kerosine ------------------------------do----	33	525	28	437
Distillate oil -------------------------do----	307	5,518	92	1,156
Residual oil ---------------------------do----	4,261	41,232	4,892	43,179
Lubricating oil ------------------------do----	[r] 11,307	321,951	8,827	300,873
Asphalt -------------------------------do----	341	5,238	245	6,222
Liquefied petroleum gases --------------do----	9,033	94,464	9,432	100,041
Wax -----------------------------------do----	862	34,464	581	27,502
Coke ----------------------------------do----	40,790	181,171	36,949	315,239
Petrochemical feedstocks ---------------do----	5,558	65,712	7,436	95,681
Miscellaneous -------------------------do----	1,194	44,433	1,088	43,976
Total ------------------------------------	XX	[r] 12,645,291	XX	14,381,190

Table 10.—U.S. imports for consumption of principal minerals and products

Mineral	1974		1975	
	Quantity	Value (thousands)	Quantity	Value (thousands)
METALS				
Aluminum:				
Metal short tons	508,643	$312,479	434,119	$316,873
Scrap do	74,743	42,569	54,806	27,586
Plates, sheets, bars, etc do	46,081	47,489	61,354	65,079
Aluminum oxide (alumina) do	3,627,024	270,617	3,507,415	370,039
Antimony:				
Ore (antimony content) do	14,655	20,866	8,320	14,535
Needle or liquated do	86	271	74	255
Metal do	2,203	7,550	2,112	5,677
Oxide do	6,269	15,580	9,908	12,588
Arsenic:				
White (As_2O_3 content) do	13,742	2,449	12,013	4,426
Metallic do	707	3,651	483	2,716
Bauxite (crude) thousand long tons	14,308	NA	10,782	NA
Beryllium ore short tons	1,368	414	[1] 1,479	[1] 468
Bismuth pounds	1,893,744	15,606	1,331,173	9,442
Boron:				
Carbide do	75,429	265	137,572	645,354
Boric acid do	844,811	149	345,237	59,339
Calcium borate (crude) do	42,427,527	852	55,282,329	1,559,662
Cadmium:				
Metal short tons	1,985	14,674	2,618	13,902
Flue dust (cadmium content) do	166	603	346	1,489
Calcium:				
Metal pounds	109,252	121	70,128	78
Chloride short tons	3,599	156	12,021	598
Chromate:				
Ore and concentrates (Cr_2O_3 content) thousand short tons	481	28,532	559	60,651
Ferrochrome do	[r] 103	[r] 55,924	198	190,630
Metal do	2	5,388	2	6,630
Cobalt:				
Metal thousand pounds	14,791	49,661	6,092	25,611
Oxide (gross weight) do	1,509	4,514	233	779
Salts and compounds (gross weight) do	2	12	41	74
Columbium ore do	3,129	3,207	1,542	2,012
Copper (copper content):				
Ore and concentrates short tons	[r] 84,728	[r] 121,422	29,301	35,649
Regulus, black, coarse do	2,426	12,033	5,675	20,560
Unrefined, black, blister do	200,607	383,491	78,969	90,846
Refined in ingots, etc do	313,349	551,442	142,945	166,159
Old and scrap do	31,109	[r] 50,641	14,399	14,459
Ferroalloys, n.e.c do	[r] 81,709	[r] 38,102	62,125	36,991
Gallium kilograms	6,536	4,107	6,830	3,555
Gold:				
Ore and base bullion troy ounces	329,357	45,974	313,088	50,055
Bullion do	2,321,981	350,706	2,348,936	406,583
Indium do	492,978	1,906	113,800	629
Iron ore thousand long tons	48,029	696,298	46,743	860,496
Iron and steel:				
Pig iron short tons	342,348	41,038	478,106	69,316
Iron and steel products (major):				
Iron products do	49,524	29,328	47,535	32,299
Steel products do	[r] 16,696,509	[r] 5,553,378	12,440,326	4,475,191
Scrap do	188,480	26,166	293,082	24,464
Tinplate do	12,645	861	12,277	786
Lead:				
Ore, flue dust, matte (lead content) do	62,691	15,180	45,024	12,329
Base bullion (lead content) do	831	331	462	183
Pigs and bars (lead content) do	118,367	57,698	99,054	46,708
Reclaimed scrap, etc. (lead content) do	1,236	834	1,741	617
Sheet, pipe, shot do	196	138	147	99
Magnesium:				
Metallic and scrap do	4,815	3,518	6,787	9,299
Alloys (magnesium content) do	440	1,573	1,111	2,215
Sheets, tubing, ribbons, wire, and other forms (magnesium content) do	50	135	5	33
Manganese:				
Ore (35% or more manganese) (manganese content) do	592,818	45,091	765,530	77,103
Ferromanganese (manganese content) do	327,874	88,426	306,650	128,381
Metal do	2,506	1,379	4,378	4,041

See footnotes at end of table.

Radium: Radioactive substitutes	NA	7,565	NA	8,297
Rare earths, ferrocerium and other cerium alloys pounds	57,519	238	33,852	187
Silicon (silicon content):				
Metal short tons	5,914	16,700	3,652	6,591
Ferrosilicon do	r 93,131	r 66,501	47,365	41,950
Silver (general imports):				
Ore and base bullion thousand troy ounces	34,568	150,284	21,197	87,755
Bullion do	89,963	432,868	61,629	274,254
Sweepings, waste, dore do	8,864	40,642	7,596	32,527
Tantalum ore thousand pounds	1,897	7,169	1,624	7,149
Tin:				
Ore (tin content) long tons	5,877	35,999	6,314	44,114
Blocks, pigs, grains, etc do	39,602	289,592	43,665	312,346
Dross, skimmings, scrap, residues and tin alloys, n.s.p.f do	1,761	1,186	2,429	2,452
Tinfoil, powder, flitters, etc	NA	9,331	NA	7,257
Titanium:				
Ilmenite [2] short tons	318,720	13,715	334,692	15,903
Rutile do	r 246,489	r 36,773	224,499	46,362
Metal pounds	20,090,390	19,546	10,549,619	18,332
Ferrotitanium do	4,592,316	3,122	1,071,048	1,125
Compounds and mixtures do	r 70,868,757	25,216	58,964,945	19,654
Tungsten (tungsten content):				
Ore and concentrates thousand pounds	11,096	40,696	6,570	31,665
Waste and scrap do	179	711	71	317
Other alloys do	2,462	9,368	1,898	11,104
Ferrotungsten do	808	3,029	418	2,542
Uranium and other uranium-bearing and nuclear materials:				
Oxide U_3O_8 do	3,670,678	30,284	2,451,538	24,481
Compounds, n.e.c do	12,866,822	90,921	19,226,578	161,507
Isotopes (stable) and their compounds	NA	1,007	NA	957
Radio isotopes, elements, etc. thousand curies	24,246,498	7,565	35,346,036	8,297
Vanadium (content):				
Ferrovanadium thousand pounds	288	1,142	273	1,455
Vanadium-bearing materials (vanadium pentoxide content) do	7,744	5,566	8,155	7,075

See footnotes at end of table.

Table 10.—U.S. imports for consumption of principal minerals and products—Continued

Mineral	1974 Quantity	1974 Value (thousands)	1975 Quantity	1975 Value (thousands)
METALS—Continued				
Zinc:				
Ore (zinc content) short tons	133,733	$31,430	428,544	$108,822
Blocks, pigs, slabs do	543,806	[r] 431,251	374,922	273,636
Sheets, etc do	640	568	236	507
Old, dross, skimmings do	3,863	1,786	3,158	1,238
Dust, powder, flakes do	9,131	9,799	5,739	5,744
Manufactures	NA	563	NA	79
Zirconium:				
Ore (including zirconium sand) do	62,504	6,398	40,205	8,874
Unwrought, scrap, compounds do	2,702	4,365	2,013	5,991
NONMETALS				
Abrasives:				
Diamond (industrial) thousand carats	[r] 18,417	62,920	14,291	53,383
Other abrasives	NA	80,054	NA	68,481
Asbestos short tons	766,164	128,822	538,558	111,011
Barite:				
Crude and ground do	764,625	9,155	672,528	9,264
Witherite do	3,435	710	85	44
Chemicals do	43,383	13,033	10,937	4,443
Cement thousand short tons	5,732	101,734	3,702	70,620
Clays:				
Raw short tons	37,012	1,778	33,851	1,644
Manufactured do	5,806	415	4,143	303
Cryolite do	21,216	6,969	22,120	9,058
Feldspar:				
Crude do	30	(3)	[1] 209	17
Ground and crushed do	62	3	81	6
Fluorspar do	1,336,389	60,988	1,050,448	61,059
Gem stones:				
Diamond thousand carats	4,533	760,040	4,577	722,119
Emeralds do	871	34,046	806	40,348
Other	NA	88,234	NA	87,963
Graphite short tons	82,636	5,677	65,663	5,698
Gypsum:				
Crude, ground, calcined thousand short tons	7,426	17,709	5,450	16,193
Manufactures	NA	4,180	NA	3,617
Iodine (crude) thousand pounds	7,970	14,849	5,809	11,721
Kyanite short tons	194	12	65	3
Lime:				
Hydrated do	48,284	1,311	44,637	1,392
Other do	367,917	6,368	214,311	4,867
Lithium:				
Ore do	3,165	323	4,548	538
Compounds do	84	249	11	107
Magnesium compounds:				
Crude magnesite do	19	1	10	1
Lump, ground, caustic calcined magnesia do	8,990	692	5,716	502
Refractory magnesia, dead-burned fused magnesite, dead-burned dolomite do	156,401	18,455	156,332	24,668
Compounds do	32,064	2,107	36,572	1,796
Mica:				
Uncut sheet and punch thousand pounds	[r] 793	947	904	696
Scrap do	6,634	193	10,672	356
Manufactures do	[r] 6,554	4,928	5,075	2,935
Mineral-earth pigments; iron oxide pigments:				
Ocher (crude and refined) short tons	53	10	20	3
Siennas (crude and refined) do	1,309	264	521	107
Umber (crude and refined) do	7,790	565	4,251	350
Vandyke brown do	958	183	319	57
Natural, other do	2,162	376	1,001	223
Synthetic do	41,943	14,969	21,867	8,444
Nepheline syenite:				
Crude do	4,605	79	6,275	98
Ground, crushed, etc do	505,028	7,558	424,838	6,869
Nitrogen compounds (major), including urea thousand short tons	3,374	345,230	3,113	415,584
Phosphate (crude) do	[1] 182	[1] 8,999	37	1,604
Phosphatic fertilizers do	202	32,512	147	26,970
Pigments and salts:				
Lead pigments and compounds short tons	14,384	10,001	15,337	7,470
Zinc pigments and compounds do	39,436	26,048	18,447	10,746
Potash do	7,265,222	256,082	6,292,329	285,272

See footnotes at end of table.

Table 10.—U.S. imports for consumption of principal minerals and products—Continued

Mineral	1974		1975

---

[p] Preliminary. NA Not available. W Withheld to avoid disclosing individual company confidential data.

[1] May not represent total world production because confidential U.S. data are excluded for some commodities. World totals include reported figures and reasonable estimates; however, for some commodities where data were not available, no reasonable estimates could be made and none have been included.

[2] Includes small quantities of lignite for the People's Republic of China and Pakistan, and anthracite for Colombia.

[3] Includes low- and medium-temperature and gashouse coke.

[4] Less than ½ unit.

[5] Includes Puerto Rico.

[6] Kaolin sold or used by producers.

[7] Year ended June 30 of year stated (United Nations).

[8] World total exclusive of the U.S.S.R.

[9] Dry bauxite equivalent of crude ore.

[10] Recoverable.

[11] Includes byproduct ore.

[12] Includes secondary.

[13] Smelter output from domestic and foreign ores, exclusive of scrap.

[14] Lead refined from domestic and foreign ores; excludes lead refined from imported base bullion.

[15] Data from American Iron and Steel Institute. Excludes production of castings by companies that do not produce steel ingot.

[16] Includes tin content of alloys made directly from ore.

Abrasive Materials

By Robert G. Clarke [1]

The production of natural abrasives varied in quantity and value compared with those of 1974. Output of tripoli-type materials and garnet both decreased in quantity and value. Special silica stone products decreased in quantity but increased in value. The production of emery increased 38% in quantity. The production of manufactured abrasive materials decreased for all types and the decreases were more in quantity than in value.

Table 1.—Salient abrasive statistics in the United States

Kind	1971	1972	1973	1974	1975
Natural abrasives (domestic) sold or used by producers:

Foreign trade (natural and artificial abrasives):					
Exports (value) -------------- do ----	$60,685	$64,219	$82,969	$115,508	$102,849
Reexports (value) ------------ do ----	$21,711	$26,746	$29,413	[r] $29,829	$28,362
Imports for consumption (value) do ----	$89,085	$106,512	$136,655	$142,974	$121,864

[r] Revised. W Withheld to avoid disclosing individual company confidential data.

[1] Includes grinding pebbles, grindstones, oilstones, tube-mill liners, and whetstones.

[2] Production of silicon carbide and aluminum oxide (United States and Canada); shipments of metallic abrasives (United States).

[3] Includes production of aluminum zirconium oxide (United States and Canada).

FOREIGN TRADE

Imports of abrasive materials were 15% less in value than in 1974, and exports plus reexports decreased in value 10%. Net exports, the excess of exports and reexports over imports, were $9.3 million, about four times that of 1974. The volume of all abrasive materials exported decreased and the value of nearly all decreased.

Industrial diamond imports totaled 14.3 million carats of loose material valued at $53.4 million, a decrease of 22% in quantity and 15% in value from those of 1974. Exports of industrial diamond, loose, were 13.8 million carats, a decrease of 8%, and the value was $38.0 million, a decrease of 6%. Reexports of similar industrial diamond were 3.2 million carats, a decrease of 12%, and the value was $28.2 million, a decrease of 5%. The diamond content in diamond wheels, exported and reexported, was 692,000 carats, a decrease of 23%, and the declared value was $5.0 million, a decrease of 11%. Imports of diamond wheels are listed by number and value; the value in 1975 decreased to $896,000 from $971,000 in 1974.

---

[1] Physical scientist, Division of Nonmetallic Minerals.

The 1975 imports of industrial diamond from Ireland totaled 4.5 million carats valued at $10.4 million, reflecting a decrease of 46% in quantity and 44% in value from those of 1974. The share of imports from Ireland was 31% of the total quantity and 20% of value. Of the industrial imported bort, powder, and dust, synthetic diamond was 3.2 million carats valued at $6.6 million and natural diamond was 5.9 million carats valued at $12.4 million.

TRIPOLI

Fine-grained, porous, silica materials are grouped together because they have similar properties and end uses. Production of crude tripoli (table 1) decreased 5% in quantity and 9% in value compared with 1974. Processed tripoli sold or used (table 5) decreased 21% in quantity and 24% in value. The uses for processed tripoli in 1975 were 57% for abrasives and 41% for fillers compared with 59% and 39%, respectively, in 1974.

Tripoli producers in 1975 were Malvern Minerals Co., Garland County, Ark., which produced crude and finished material; Midwestern Minerals Corp., Ottawa County, Okla., which produced crude and finished material; and American Tripoli Co., Division of The Carborundum Co., which produced crude in Ottawa County, Okla., and finished material in Newton County, Mo. Illinois Minerals Co., and Tammsco, Inc., both in Alexander County, Ill., produced amorphous silica. Keystone Filler and Mfg. Co., in Northumberland County, Pa., mined and processed rottenstone.

Prices quoted in Engineering and Mining Journal, December 1975, for tripoli and amorphous silica were as follows:

Tripoli, paper bags, carload lots, f.o.b., in cents per pound:	
White, Elco, Ill.: Air floated through 200 mesh ----	1.4
Rose and cream, Seneca, Mo. and Rogers, Ark.:	
Once ground ----	2.90
Double ground ----	2.90
Air float ----	3.15
Amorphous silica, bags, f.o.b., in dollars per ton:	
Elco, Ill.:	
Through 200 mesh, 90% to 95% ---	$28
Through 200 mesh, 96% to 99% ---	29
Through 325 mesh, 96% to 98% ---	32.50
Through 325 mesh, 98% to 99.4% --	34
Through 325 mesh, 99.5% ----	48.50
Through 400 mesh, 99.9% ----	71

[1] Includes amorphous silica and Pennsylvania rottenstone.
[2] Partly estimated.
[3] Data may not add to totals shown because of independent rounding.

SPECIAL SILICA STONE PRODUCTS

Special silica stone products produced in 1975 included oilstones from Arkansas, whetstones from Arkansas and Indiana, grindstones from Ohio, grinding pebbles and deburring media from Minnesota and Wisconsin, and tube-mill liners from Minnesota.

Producers of oilstones and whetstones in Garland County, Ark., were John O. Glassford, Hiram A. Smith, Inc., Arkansas Abrasives, Inc., and Norton Pike Division of Norton Co. Whetstones were produced by Milroy and Smith in Hot Springs County, Ark., and by K & K Mines, Inc., in Pike County, Ark. Hindostan Whetstone Co. operated a plant in Lawrence County, Ind., to finish stone obtained from a quarry in Orange County, Ind. Cleveland Quarries Co. produced grindstones at its Amherst quarry, Lorrain County, Ohio. Jasper Stones Co. produced grinding media, rough and rounded, from its quarry in Rock County, Minn., and Baraboo Quartzite Co., Inc., produced deburring media at its quarry in Sauk County, Wis.

[1] Includes grinding pebbles, grindstones, oilstones, tube-mill liners, and whetstones.

NATURAL SILICATE ABRASIVES

Garnet.—Sales of domestic garnet decreased 30% in quantity and 34% in value from the highs of 1974. Three producers were active in 1975—two in Idaho and one in New York. Barton Mines Corp., Warren County, N.Y, sold garnet for use in coated abrasives, glass grinding and polishing, and metal lapping. Emerald Creek Garnet Milling Co., and Idaho Garnet Abrasive Co., both in Benewah County, Idaho, reported their garnet was used in sandblasting, water filtration, as a filler in rubber products, and as an additive in decorations.

Prices for Idaho garnet, f.o.b. Fernwood, Idaho, ranged from 4.0 to 7.0 cents per pound. Prices for New York garnet, f.o.b. North Creek, N.Y., ranged from 15 to 35 cents per pound.

Table 7.—Abrasive garnet sold or used by producers in the United States

Year	Quantity (short tons)	Value (thousands)
1971	18,984	$1,934
1972	18,916	1,957
1973	22,772	2,380
1974	24,684	2,551
1975	17,204	1,690

NATURAL ALUMINA ABRASIVES

Corundum.—No domestic corundum was produced in 1975. Requirements for domestic consumption were met by imports mainly from the Republic of South Africa. A small quantity of corundum was imported from India. Total imports were 1,124 tons at a declared value of $80,888.

Prices quoted in Engineering and Mining Journal, December 1975, for crystal corundum, per short ton of crude, c.i.f. U. S. ports, were $150 to $160.

Emery.—Three producers of emery were active in 1975: De Luca Emery Mine, Inc., and Emeri Crete, Inc., both near Peekskill in Westchester County, N.Y., and Oregon Emery Co., near Sweethome in Linn County, Oreg. Domestic emery was used mostly in aggregates as a nonslip additive for floors, pavements, and stair treads. The minor use for domestic emery was in abrasive materials for coated abrasives and tumbling or deburring media. The quantity of emery produced was 3,487 tons.

World production data for emery are principally for Greece and Turkey. In 1974, production of emery in Greece was estimated to be 7,716 tons. Production of emery in Turkey in 1974 was reported as 166,210 tons. No value was placed on the production in either country.

Prices quoted in Industrial Minerals, No. 99, December 1975, for emery, per metric ton, c.i.f. main European port, were as follows, in dollars:

Coarse grain	$150–$160
Medium and fine grain	160– 180

Table 8.—Natural corundum: World production, by country
(Short tons)

Country[1]	1973	1974	1975[p]
India	[r] 293	360	337
South Africa, Republic of	297	278	266

Uruguay	335	366	460
Total	[r] 8,625	8,704	9,363

• Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, Southern Rhodesia presumably continued to produce natural corundum at a significant level (several thousand tons annually), and both Argentina and Kenya may have produced minor quantities of this commodity, but output is not reported and available information is inadequate for formulation of reliable estimates of output levels.

INDUSTRIAL DIAMOND

Domestic production of synthetic industrial diamond in 1975 was estimated to be 19 million carats, unchanged from that of 1974. Secondary production, comprising salvage from used diamond tools and from wet and dry diamond-containing wastes, was estimated to be 2 million carats subject to revision following a consumption canvass by the Department of Commerce.

The Government stockpile inventory as of December 31, 1975, was 33.6 million carats of crushing bort and 20.0 million carats of stones. The objectives for both categories are zero, and the inventories were considered excess. Available for disposal from prior enabling legislation were 9.9 million carats of bort. The inventory of small diamond dies was 25,473 of which the objective was 7,900 and 17,573 was excess.

Exports and reexports of industrial diamond dust and powder, which included synthetics, were 13.2 million carats valued at $33.0 million. Crushing bort, except dust and powder, exported was 374,000 carats valued at $2.0 million. Exports and reexports of stones were 3.4 million carats valued at $31.2 million. The total of exports and reexports of dust and powder, bort, and stones was 17.0 million carats valued at $66.3 million.

WORLD REVIEW

Angola.—The financial strength of the Portuguese firm, Companhia de Diamantes de Angola (Diamang) deteriorated in 1974 and 1975.[2] Late deliveries, chaos at Angolan ports, the steady exodus of trained personnel, a breakdown in discipline and work output, and the collapse of public authority contributed to the decline. Diamang's production is derived from alluvial diamond-bearing gravels in areas drained by some of the principal river systems of central and southern Angola. Mechanical excavators and hydraulic monitors, as well as manual shovels, are used for stripping. In 1974 the volume of overburden removed was 12.96 million cubic yards, or 22% less than that of 1973. The volume of diamondiferous material treated at the plants serving the mines was less by 10% at 5.84 million cubic yards and production in 1974 of 1.96 million carats was 8% less than in 1973.

Botswana.—A new tax agreement regarding diamond mining at Orapa and Letlhakine (formerly the DK 1 and 2 complex) was announced by the Government of Botswana and DeBeers Botswana Mining Co. on July 23, 1975.[3] The agreement, for which negotiations took 2 years, provides for increasing Orapa's production to 4.5 million carats per year by 1979 from the present 2.4 million carats. The Letlhakine mine is expected to produce about 400,000 carats annually by 1979. Changes in the tax structure are expected to give the Government between 65% and 70% of diamond profits through taxes, royalties, and dividends. The Government's equity in the mining company will be increased from 15% to 50%. The Government and DeBeers will be equally represented on the company's board of directors. DeBeers will retain responsibility for technical supervision, and diamond production will continue to be marketed through the Central Selling Organization in London.

Brazil.—Anglo American Corp. (AAC) joined Icome (Bethlehem Steel Corp./ Hanna Mining Co.) to form Sopermi (40% AAC, 60% Icome), an exploration firm which is active in Minas Gerais and Mato Grosso.[4] Results of a 4-year aerial infrared photographic survey of the Amazon region indicated areas suitable for prospecting for diamond in the Tumucumaque Mountains and in Roraima.

Central African Republic.—Diamond output in the Central African Republic attained a level of 339,000 carats in 1975 which was slightly above the 338,000 carats produced in 1974. The value of 1975 production was $14.7 million compared to $14.4 million in 1974. The 1975 value reflects the lower dollar exchange rates which prevailed in 1975 (diamonds are priced in dollars); however, stone quality and generally rising diamond prices more than compensated for this decrease.

All diamonds in the Central African Republic to date have been found in alluvial fans, basins, water courses and stream beds. As these formations are not conducive to large-scale mining operations, most diamonds are found by individuals and small groups. As panning and mining operations have continued over the years, diamonds have become increasingly more difficult to recover and mining now requires larger capital expenditures. In order to maintain and expand production, Diamond Distributors International (United States), COMINCO, Ltd. (Canada), and the Government of the Central African Republic established a local firm, Société Centrafricaine d'Exploitation Diamantifere (SCED), in late 1973 to mechanize mining and dredging operations and to provide technical assistance to artisanal diggers. SCED has had two successful years and has been largely responsible for maintaining diamond production at constant levels.

The quality of these diamonds is very good; 60% to 70% are of gem grade. Most stones are exported uncut to Europe, Israel, or the United States. About 5% of the diamonds are cut locally by skilled Central African artisans in Black Africa's only diamond cutting factory. Diamond exports to the United States totaled $6.8 million for gem stones and $464,000 for industrial diamonds in 1974. Diamonds comprise an important element in the foreign exchange earnings and tax revenues of the Central African Republic and the Government is vitally interested in maintaining and expanding production. Over the past decade diamonds have accounted for about 30% of the nation's foreign exchange earnings.

[4] Mining Journal. AAC: Brazilian Diamond Interest. V. 284. No. 7295, June 13, 1975, p. 463.

Ghana.—In 1975 Cayco Ltd., Ghana Consolidated Diamond Ltd., (GCDL), Dunkwa Goldfields, and licensed individual diggers were mining diamonds in Ghana.[5] Amalgamated Diamond Corp. ceased production in late 1973, and Cayco's production has decreased significantly since 1968. Cayco's and GCDL's concessions are located in the Birim Basin of Eastern Ghana. Dunkwa Goldfields has a dredging operation on the Jimi River in the Ashanti region which recovers gem-quality stones in the 2- to 4-carat range. Gem stones are also found in the Bonsa Valley of Western Ghana but are generally too small for commercial purposes. About 90% of Ghana's production is industrial-grade diamonds. The First International Natura Corp., a New York-based company with substantial U.S. investment, is negotiating with the Government of Ghana to obtain mining rights in a 25-square-mile area at the confluence of the Birim and Pra Rivers. The Government will have a 55% equity in the project.

Diamond production is marketed exclusively by the Diamond Marketing Corp. (DMC). Its functions are to grade, value, and process diamonds as well as to buy all those won locally. All companies sell directly to DMC except GCDL, which sells through DMC. DMC sells diamonds to end users abroad with the assistance of Consolidated African Selection Trust Ltd. (CAST) in London. CAST owns 45% of GCDL. The majority of Ghana's diamonds are exported to the United Kingdom, the Netherlands, and Belgium-Luxembourg.

Lesotho.—Following almost 2 years of negotiations, Prime Minister Leabua Jonathan and DeBeers Consolidated Chairman Harry Oppenheimer signed an agreement which will open a new diamond mine in Lesotho.[6] The mine will be controlled by a newly formed company, DeBeers Lesotho Mining Co., Ltd., in which Lesotho will hold a 25% equity. DeBeers is committed to invest $35 million over 2 years.

The agreement permits development of Lesotho's only identified kimberlite diamond pipe at Letseng la Terae in the northeastern district of Mohkotlong. Mine production is expected to start in late 1976 or early 1977. Capacity will be approximately 4,400 tons per day. Site preparation has already started. Output will be marketed through a second company to be formed by DeBeers and registered in Lesotho.

According to the agreement, Lesotho will be able to charge a sales tax of about 15% on mine production until DeBeers recovers its capital costs. After that, Lesotho can continue to collect the sales tax on gross profits or 25% of profits after taxes plus 50% of the gross income, whichever is greater. Thus, if the mine proves profitable, Lesotho starts with a 62.5% share of the profits. If the profit ratio rises to previously agreed levels, the Government can increase taxes on profits to 62%, increasing its share to 71.5%.

Sierra Leone.—The 51% Government-owned National Diamond Mining Co. began prospecting new areas of the Southern Province to replace existing diamond deposit areas which are being mined out. An American firm, Diamond Distributors, International, Inc., of New York, acquired a prospecting license for diamond and gold.

South Africa, Republic of.—Diamond sales by the Central Selling Organization in 1975 were R793.5 million ($1.066 million), or 6.5% lower than in 1974.[7] During the period excess production was put into stocks and no breakdown was given for sales of either gem stones or industrial diamond. Sales of natural and synthetic industrial diamond were generally lower in 1975 than in 1974, but drilling products maintained the previous year's high level of sales. The nondiamond superhard abrasive, cubic boron nitride, was launched commercially under the name Amber Boron Nitride and is produced in South Africa.

At the dormant Kimberley mine the unusually heavy rains in recent years caused severe slope failures on the sides of the open pit mine. These were the first major ground movements of recent years and, to protect buildings and services in the adjacent areas, it was decided to construct a drainage tunnel to stabilize the ground. Work on this project commenced in November 1975 and is expected to be completed in 1977.

U.S.S.R.—A major exhibition of industrial diamond and superhard tooling materials, Almaz–75 (Diamond–75), was staged in Moscow January 28 to February 18, 1975.[8] The exhibition, sponsored by the U.S.S.R. Ministry of Machine Tools and Tooling, was in the Chemical Industry Pavilion at the Permanent Exhibition of Economic Achievements, a complex on the northern outskirts of Moscow. According to Pravda the total material content of all tools in the show exceeded 260,000 carats. Various Soviet natural and synthetic diamond abrasive grits and finer sizes were displayed and some could be examined under a microscope. Virtually every facet of industrial diamond application was demonstrated live except frame and circular sawing of natural stone and concrete for which only the 6-foot-diameter saws and sawn products were displayed.

Zaire.—Société Minière de Bakwanga (MIBA) Zaire's state-owned diamond mining company, reported diamond production reached 12,990,558 carats in 1974, a substantial increase from the previous year's output of 12,004,498 carats. Sales totaled 23,314,841 Zaires (1 Zaire (Z) equals US$1), including Z450,007 from sales of exterior stock maintained in London in 1974. In 1973 total sales were Z22,447,168 based on 12,004,498 carats from current output and 1,254,048.50 carats released from the London stockpile. Despite the increased output, the volume of required earthmoving was only 5,064,238 cubic yards, a 14% decrease from total earth moved in 1973. MIBA plans to relocate part of the Mbuji-Mayi River to mine the riverbed during 1975.[9]

TECHNOLOGY

It is reportedly possible to synthesize diamond by growing it from existing diamonds in a low-pressure gas rich in carbon.[10] The fact that graphite and diamond have an identical natural composition suggested attempts to convert graphite into diamond by applying high pressure to graphite at high temperatures, the conditions under which natural diamond is assumed to form deep in the earth. This objective was attained in 1955 by a research and development group at the General Electric Co. After 1955 a group at the Institute of Physical Chemistry in Moscow explored the possibility of diamond synthesis at low pressure. They now claim a means of enlarging a seed crystal of diamond by exposing it to a carbonaceous gas at a pressure of less than 0.001 atmosphere.

The Mines Division of DeBeers Diamond Research Centre in Johannesburg, Republic of South Africa, reported progress on numerous projects among which were the following:[11]

As a replacement of a greasebelt circuit, a high-intensity magnetic separation pilot plant was installed at the Finsch mine for recovering diamond smaller than 3 millimeters from gravity concentrates.

A prototype magnetohydrostatic separation unit for final sorting was developed and operated at the Research Centre.

Froth flotation techniques for the primary recovery of fine diamond, smaller than 200 micrometers, were used successfully in the laboratory.

The selection of type II–A diamond from bulk diamond has been simplified with the installation of a new sorting device based on ultraviolet photography. Type II–A images are identified on film and a mechanism removes the corresponding stones from the grind. Type II–A diamonds are used as heat sinks in miniature electronic devices.

Diamond is used as a heat sink for semiconductor microwave devices because of its high thermal conductivity. The thermal conductivity of diamond heat sinks can be measured by determining temperature gradients with a radiation detector.[12] The results are accurate to 10% to 15%. Type II–A diamond is preferred for its high thermal conductivity.

Abstracts relative to properties of diamond hard materials, machines, and patents were published monthly in the Industrial Diamond Review. Each issue, January to December 1975, contained from 14 to 18 pages of abstracts and patent information.

e Estimate. p Preliminary. r Revised.

[1] Total diamond output (gem plus industrial) for each country is actually reported except where indicated to be an estimate. In contrast, the detailed separate reporting of gem diamond and industrial diamond represents Bureau of Mines estimates in the case of every country except Central African Republic (1973), Lesotho (1973–1975), Liberia (1973 and 1974), Guyana (1973) and Venezuela (all years) where sources give both total output and detail. The estimated distribution of total output between gem and industrial diamond is conjectural in the case of a number of countries, based on unofficial information of varying reliability.

[2] Exports of diamond originating in Lesotho; excludes stones imported for cutting and subsequently reexported.

[3] Exports.

[4] Partial figure, January 1 through December 15 only.

[5] All company output from the Republic of South Africa except for that credited to the Premier mine; also excludes company output from the Territory of South-West Africa and Botswana.

ARTIFICIAL ABRASIVES

Five firms produced crude fused aluminum oxide in the United States and in Canada in 1975. Operators of plants in both countries were: The Carborundum Co., Norton Co., and General Abrasive Co., Division of U.S. Industries Inc. The Exolon Co. and Simonds Canada Abrasive Co, Ltd., operated plants in Canada. The production of white, high-purity material was 18,164 tons and production of regular grade was 122,828 tons. Of the combined output of white and regular, 12% was used for nonabrasive applications, principally in the manufacture of refractories. The production was 51% of the rated capacity of the furnaces used to produce fused aluminum oxide.

Two firms, The Carborundum Co. and General Abrasive Co., produced fused alumina zirconia abrasive in the United States and in Canada; and two firms, Norton Co. and Exolon Co., operated plants in Canada. All production was reportedly used for abrasive applications. The output was 48% of the capacity of the furnaces assigned to the production of fused alumina zirconia.

Six firms in the United States and in Canada produced silicon carbide in 1975. The Carborundum Co. operated plants in both countries. Electro-Refractories & Abrasives Canada, Ltd., Exolon Co., Norton Co., and General Abrasive Co., operated in Canada. These five companies produced crude for abrasive, refractory, and other nonabrasive uses. Satellite Alloy Corp. operated in the United States and produced crude for nonabrasive applications. Production by the six firms was 70% of capacity and 42% was reportedly used for abrasive applications. Nonabrasive use was 58% of the output and was mostly for refractory and metallurgical applications.

In the Stockpile Report to the Congress by the General Services Administration the inventory of crude fused aluminum oxide in calendar 1975 was reduced to 265,982 tons, uncommitted excess, a reduction of 1,080 tons as of December 31; the stock of aluminum oxide grain was unchanged at 50,905 tons; and the stock of silicon carbide crude was reduced by 38,246 tons to 80,619 tons, uncommitted excess.

Metallic abrasives were produced by 13 firms in the United States in 1975. Steel shot and grit comprised 74% of the total quantity sold or used; chilled iron shot and grit, 15%; annealed iron shot and grit, 11%; other metallic abrasives comprised the remainder. The amounts from Ohio were 32% of the total sold or used, the highest of the producing States. Michigan, Indiana, Pennsylvania, Alabama, New York, and Connecticut followed in quantity sold or used. Three companies recycled material: Copperweld Steel Co. of Glassport, Pa.; Industeel Corp. of Pittsburgh, Pa.; and Kohler Co. of Sheboygan, Wis.

Table 12.—Producers of metallic abrasives in 1975

TECHNOLOGY

Machine builders and grinding wheel users discussed the status of metrication in the grinding wheel industry at the 1975 Mid-Winter Conference of the Grinding Wheel Institute and the Abrasive Grain Association, February 4–5, 1975, Buffalo, N.Y.

Proponents of superabrasives claimed that a major part of the field of precision grinding of mild steels can be won by the superabrasives, diamond and cubic boron nitride.[13] The optimism of the proponents is not shared by some consumers because of the cost of the abrasive grain. For example, a pound of cubic boron nitride grain costs about $4,500 whereas a pound of silicon carbide costs 35 to 40 cents. However, the superabrasives outperform aluminum oxide and silicon carbide grinding wheels in both productivity and total costs.

The Manufacturing Development Staff of General Motors Corp. described progress on advanced abrasive machining concepts of grinding wheels up to 15 feet in diameter which would have cutting speed capability of 27,000 to 36,000 surface feet per minute.[14] The engineering development work must insure a safe system with regard to structural stiffness of the wheel versus vibration, retention of abrasive segments versus centrifugal force, and mechanical stability of the total installation versus machine part irregularities.

[1] The total quantity of the various types of metallic abrasives that a plant could have produced during the year, working three 8-hour shifts per day, 7 days per week, allowing for usual interruptions, and assuming adequate fuel, labor, and transportation.

[2] Included in capacity of chilled iron shot and grit.

[3] Includes cut wire shot.

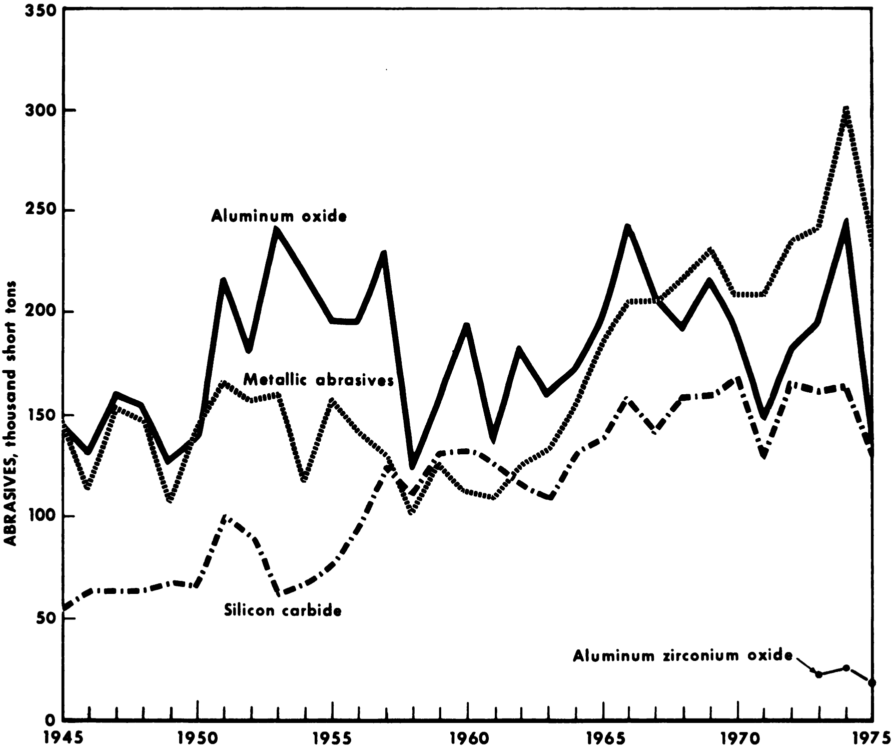

Figure 1.—Artificial abrasives production.

Aluminum

By John W. Stamper [1] and Christine M. Monroe [2]

Owing to the slowdown in economic activity throughout the world, world demand for aluminum was 15% below the 1974 level. This was the largest percentage decline in aluminum demand in modern times. Output of primary metal declined in all of the major producing countries except the United Kingdom and the U.S.S.R. Production was only 77% of yearend capacity in the United States, 86% in Canada, and 75% in Japan; however, relatively high operating rates were maintained in France and West Germany, and world production of primary aluminum was only 9% below that of 1974. World stocks of primary aluminum metal were estimated to have increased more than 50%. Total metal inventories increased 30%.

Production expansion plans in Canada, Norway, Japan, and New Zealand were delayed, but new projects in Canada, Brazil, Abu Dhabi, Saudi Arabia, and the Republic of Korea were announced. Construction of new alumina reduction plants was started in Venezuela, Dubai, and Japan.

Table 1.—Salient aluminum statistics

r Revised.

U.S. aluminum demand, as measured by net shipments of aluminum ingot and mill products to domestic industry, dropped almost 30%. Despite a 21% reduction in the output of primary metal, equivalent to a million tons less than in 1974, total metal inventories held by the domestic industry at yearend 1975 increased by 422,000 tons and were almost 20% greater than the inventory held at the beginning of the year.

Legislation and Government Programs.—The shipment of 2,486 tons of primary aluminum from government inventories during 1975 under the aluminum disposal program that became effective November 23, 1965, brought the total shipped under the program to 1,866,970 tons.

On July 11, 1975, the Council on Wage and Price Stability requested the aluminum industry to delay the price increases for primary aluminum ingot, which the industry had announced at midyear, until August 7 so that the Council could study the justification for the increases. After hearing the industry's statements on July 21 and 22, the Council concluded that it would not request any further delay in the price increases and indicated that the rising costs of producing aluminum were well documented. The price rise was implemented on August 11.

[2] Statistical assistant, Division of Nonferrous Metals.

DOMESTIC PRODUCTION

Primary.—Domestic primary aluminum production capacity increased slightly during 1975 to 5,021,000 tons. However, owing to decreased demand, primary smelters operated at 74% of rated capacity during the second half of the year, and primary production decreased 21% from the 1974 level. Of the major producers, Aluminum Company of America (Alcoa) cut production by 26%, Kaiser Aluminum & Chemical Corp. (Kaiser) by 27%, and Reynolds Metals Co. (Reynolds) by 33%. The Anaconda Aluminum Co. (Anaconda) operated at 70% of rated capacity, and Martin Marietta Aluminum, Inc., at 81%.

Alcoa announced the startup of part of a new 130,000-ton-per-year potline at its Massena, N.Y., smelter. The new unit replaced three older lines and reportedly used 10% less energy per pound of aluminum produced than the older lines. Alcoa also announced the postponement of plans to double the capacity of its lignite-fired powerplant at Rockdale, Tex.

The Pechiney Ugine Kuhlmann Group (PUK) acquired the remaining 30% interest in the Howmet Corp., which owned both 50% of the Eastalco Aluminum Co. smelter at Frederick, Md., and 50% of the Italco Aluminum Corp. plant at Ferndale, Wash. The remaining 50% of each plant was owned by Alumax, Inc., which in turn was owned 50% by AMAX Inc., 45% by Mitsui & Co. Ltd., and 5% by Nippon Steel.

Table 2.—Production and shipments of primary aluminum in the United States
(Short tons)

Quarter	1974		1975

Alumax, Inc., announced the completion of an 87,600-ton-per-year potline at Frederick, Md., bringing total capacity of the Eastalco plant to 176,000 tons per year. Ownership of the facility at yearend consisted of Alumax, Inc., 50% and PUK, 50%. Alumax obtained the required Federal and State permits for a 187,000-ton-per-year smelter at Umatillo, Oreg., but encountered further delays when the Federal district court ordered that the company postpone signing a power con- ract with the Bonneville Power Adminis- ration until an environmental impact report had been filed. Nippon Steel pur- hased 5% of the Mitsui Aluminum Co. Ltd. 50% interest in Alumax, Inc., for 14.6 million.

The Japanese consortium consisting of umitomo Chemical Co., Ltd., Kobe Steel Ltd., Nippon Light Metal Co., Ltd., Marubeni Corp., Sumitomo Shoji Kaishe Ltd., and Kanematsu Gosho KK, withdrew from the Revere Copper & Brass, Inc., 120,000-ton-per-year expansion at Revere's Scottsboro, Ala., smelter.

The Aluminum Association announced that since 1972 the aluminum industry had reduced energy consumption 6.5% per pound of aluminum produced. The aluminum industry set a goal of reducing energy consumption 10% between 1972 and 1980.

Secondary.—Recovery of secondary aluminum-base scrap, calculated from reports to the Bureau of Mines, was 980,340 tons, slightly less than the quantity recovered in 1974. Calculated recovery of all metallic constituents from aluminum-base scrap in 1975 declined slightly to 1,048,875 tons.

The Bureau estimated that full coverage of the industry would indicate a total scrap consumption of 1,448,000 tons in 1975. On this basis, aluminum recovery would total 1,156,000 tons, and total metallic recovery would be 1,239,000 tons.

U.S. Reduction Co. announced plans to construct a $3 million plant to separate salt from aluminum slag, at a rate of 50,000 tons per year. In November, American Can Co. signed a letter of intent to purchase the U.S. Reduction Co. for approximately $36 million. U.S. Reduction was the largest independent secondary aluminum smelter operation in the United States.

Decreased demand and increased inventories forced many secondary aluminum producers to reduce operations during the year. U.S. Reduction closed the Alton, Ill., secondary smelter during July.

Recycling technology developed by the Bureau of Mines was scheduled to be the nucleus of three new urban refuse recycling plants that will recover significant quantities of aluminum-base scrap. A plant in Montgomery County, Md., was scheduled to have a 1,200-ton-per-day capacity initially and was to be expanded to 2,000 tons per day by 1985. A recycling plant in Baltimore, Md., was under construction and was scheduled to begin operating in 1976. The plant in Montgomery County, Md., and one in Monroe County, N.Y., were in the design phase, and were scheduled to open in 1977 and 1978, respectively.

Table 4.—Aluminum recovered from purchased scrap processed in the United States, by kind of scrap and form of recovery
(Short tons)

Kind of scrap	1974	1975
New scrap:		
Aluminum-base	[1]779,978	[2]696,698

Total	679,462	659,696	547,619	538,745

W Withheld to avoid disclosing individual company confidential data. Data included in the miscellaneous, other category.

[1] Gross weight, including copper, silicon, and other alloying elements. Secondary smelters used 39,301 and 16,902 tons of primary aluminum in 1974 and 1975, respectively, in producing secondary aluminum-base alloys.

[2] No allowance was made for consumption or receipts by producing plants.

[3] Not reported separately prior to 1975; probably included in the miscellaneous, other category.

[4] Included under the miscellaneous, Pure (97.0% Al) category.

[5] Includes alloys 122 and 138, reported as separate items prior to 1975, and data withheld.

CONSUMPTION

Domestic consumption as measured by net shipments of aluminum ingot and mill products to domestic industry was 29% below the 1974 level. Shipments to the building and construction industry, the largest user of aluminum, decreased 29% from 1974 shipments. The containers and packaging industry was the second largest user of aluminum with shipments totaling 1,000,500 tons, 12% less than the 1974 level. Transportation applications decreased 30%, and shipments to electrical markets also decreased markedly.

The average quantity of aluminum used in 1975 model automobiles was approximately 84 pounds per car, and reported estimates indicated that 1976 models would use 87 pounds per unit. By 1980 between 180 and 200 pounds was expected to be required per unit.

Although shipments of sheet to can manufacturers decreased, aluminum was reportedly used for about 25% of the metal cans manufactured in 1975, compared with about 20% in 1974, 17% in 1972, and 10% in 1970.

Table 8.—Distribution of end use shipments of aluminum products

Industry	1974 [r]		1975

p Preliminary.

[1] Includes a small amount of rolled structural shapes.

[2] Includes a small amount of heat-treatable welded tube.

[3] Less than 0.1%.

STOCKS

Due to increased demand, reported industry stocks of primary aluminum ingot at reduction plants increased dramatically from 145,757 tons at the beginning of the year to 379,564 tons at yearend. A peak of 450,211 tons was reached at the end of June. The Bureau of Domestic Commerce (BDC) reported an increase in metal inventories at reduction and other processing plants. Total industry stocks of aluminum metal, including scrap, increased from 2,577,758 tons at the beginning of the year to 2,999,352 tons at yearend.

PRICES

The price of 99.5% pure primary aluminum was quoted at 39.0 cents per pound from January 1 until August 7, when producers, after hearings before the Council on Wage and Price Stability, raised the price to 41.0 cents per pound. Dealer quotes for primary aluminum increased from a range of 35.0 to 35.5 cents per pound at the beginning of the year to a maximum range of 37.0 to 38.5 cents per pound during August, and then declined to a range of 34 to 35 cents per pound at yearend. Prices quoted by the American Metal Market for smelters' secondary aluminum alloys decreased from a range of 47.0 to 58.0 cents per pound at the beginning of the year to a range of 40.5 to 50.0 cents per pound at yearend.

FOREIGN TRADE

Reflecting weak world demand, exports of crude and semicrude aluminum metal including scrap decreased about 16% from the 1974 level. Canada was the principal destination of U.S. aluminum exports. The People's Republic of China received 37%, or 68,906 tons, of the primary aluminum ingot exports. Japan was the principal destination of U.S. scrap exports with 22,558 tons, or 34%. Mexico and the United Kingdom were other major recipients of U.S. aluminum exports.

U.S. imports for consumption of crude and semicrude aluminum decreased 13% from the 1974 level. Scrap imports were off 27%, but imports of semimanufactured forms increased sharply with Belgium, Norway, and Japan increasing their shipments to the United States during 1975. Principal sources of aluminum imports were Canada, Ghana, Belgium, Japan, Surinam, and the U.S.S.R.

WORLD REVIEW

As demand slackened during 1975, stocks of primary aluminum held by members of the International Primary Aluminium Institute (IPAI) increased dramatically. IPAI member stocks, which represent the bulk of inventories held outside the centrally controlled economies, increased 55% over 1974 levels. The peak level was reached during the third quarter, and members' stocks decreased slightly by yearend.

Production rates at primary smelters reportedly were reduced in many countries. At yearend, Canada operated at about 86% of total capacity, Norway at 89%, West Germany at 90%, France at 94%, Japan at 75%, and Australia at 93%.

Expansion plans in Canada, Norway, Japan, and New Zealand were delayed. However, new projects were announced in Canada, Brazil, Zaire, Abu Dhabi, Saudi Arabia, and the Republic of Korea. Construction started on new smelters in Venezuela, Dubai, and Japan.

e Estimate. p Preliminary. r Revised.

[1] Output of primary unalloyed ingot unless otherwise specified.

[2] In addition to the countries listed, Turkey produced aluminum in 1973 and 1974, and may have had additional output in 1975, but production is unreported and information is inadequate to make reliable estimates of output levels.

[3] Includes secondary.

[4] Includes alloys.

[5] Includes superpurity aluminum as follows in short tons: 1973—6,526; 1974—6,206; 1975—3,274.

Abu Dhabi.—Nissho Iwai Co. Ltd. and British Smelter Construction Ltd. announced a feasibility study for a 165,000- to 200,000-ton-per-year smelter. Plans reportedly called for initial production of 28,000 tons by 1979.

Australia.—Comalco Ltd. continued plans for an alumina reduction plant on Boyne Island. Startup of the 110,000-ton-per-year potline was expected by 1980. Mitsubishi Chemical Industries Ltd. and Kobe Steel Ltd. reportedly would be partners in the project. Comalco postponed the startup of a 20,000-ton-per-year expansion at its Bell Bay smelter until 1977.

Bahrain.—Aluminium Bahrain Ltd. (ALBA) announced plans to add another potline by 1979. The expansion would bring the rated capacity to 156,000 tons per year. Alumina for the plant was supplied by Alcoa of Australia Ltd. from its Kwinana refinery. ALBA also announced plans to expand its production of extrusion billet from 14,000 tons per year to 33,000 tons per year.

Brazil.—Negotiations continued on the Aluminío do Brasil (Albras) alumina-aluminum project near Belem. The state-owned Companhia Vale do Rio Doce (CVRD) agreed to finance the $1.4 billion hydroelectric project on the Tocantins River. Electrobras reportedly signed a contract with Camargo Corea S.A. for the construction of the power facility, which was scheduled to be completed by late 1981.

The Light Metal Smelters Association (LMSA), the Japanese group that includes Nippon Light Metal Co., Ltd., Showa Denko K.K., Sumitomo Chemical Co. Ltd., Mitsubishi Chemical Co. Ltd., and Mitsui Aluminium Co. Ltd., requested that the project be scaled down to include a 353,000-ton-per-year smelter and a 716,000-ton-per-year alumina refinery. The alumina-aluminum complex, owned 51% by CVRD and 49% by LMSA, would be supplied with bauxite from Trombetas.

CVRD also announced that it was looking for partners for a smelter to be located on Sepetiba Bay near Rio de Janeiro. Tentative plans called for two 44,000-ton-per-year potlines to come onstream in 1979 and 1980, respectively. The plant, which would serve as a model for the Albras project, would use imported alumina.

Mitsubishi Chemical and Swiss Aluminium Ltd. (Alusuisse) announced a feasibility study for a $400 million smelter in the Amazon region. Work on the 220,000-ton-per-year smelter was scheduled to start in 1977 with no announced startup date. Alumina would initially be supplied by Alusuisse foreign plants and later from Mitsubishi bauxite reserves in Brazil. Mitsubishi would take half of the plant's metal production.

Sumitomo Chemical announced a target date of 1977 for the startup of a 170,000-ton-per-year smelter in Recife. Cost of the plant was estimated at $200 million.

Companhia Brasileira de Alumínio (CBA) received a loan from the Brazilian National Economic Development Bank to expand the Sorocaba aluminum smelter to 120,000 tons per year by adding a third potline. Expansion began in 1975 to raise the capacity of the plant to 88,000 tons per year. CBA recently acquired a hydroelectric plant on the Sorocaba River which would supply the additional power requirements of the expansions.

The Alumínio do Brasil Nordeste S.A., 28,000-ton-per-year smelter at Aratu was completed.

Canada.—The Government of Quebec and National-Southwire Aluminum Co. announced plans for a 125,000-ton-per-year smelter in St. Augustin, Quebec. The plant would be constructed and owned by Quebec General Investment Corp. National Southwire would supply technology and would receive 30% of the output. The $450 million complex was scheduled to come onstream in 1978 and would include fabricating facilities.

The Aluminum Company of Canada, Ltd. (Alcan) formed a new subsidiary, Alcan Smelters and Chemicals, Ltd., to consolidate all smelting, chemical, and related activities.

Alcan operated at 79% of its 1-million-ton-per-year rated capacity during most of 1975. Labor disputes at the Kitimat, British Columbia, and Arvida, Quebec, smelters were reported. Alcan signed a 20-year technical exchange agreement with Nippon Light Metal Co. Ltd., which is owned 50% by Alcan.

China, People's Republic of.—The Chinese reportedly bought up to 200,000 ton of primary aluminum from western producers. Kaiser Aluminum & Chemica Corp. sold 50,000 tons, to be delivere primarily from its Tacoma, Wash., an Chalmette, La., smelters. Howmet Corp., subsidiary of PUK, reportedly sold 20,000 tons to the Chinese. Other companies that sold primary ingot to the Chinese included Alcan and A/S Årdal og Sunndal Verk (ASV).

Dubai.—Construction on a 135,000-ton-per-year aluminum smelter at Jebel Ali started. Completion of the $310 million facility was scheduled for 1978, with full production expected in 1981. The infrastructure would allow for an additional 45,000-ton-per-year expansion. The plant, which would probably use diesel oil to generate electricity, was to be owned 80% by the Dubai Government, 10% by Southwire Co. which would supply the technology, and 10% by British Smelter Construction which conducted the feasibility study.

France.—PUK announced a $25 million modernization program for its Lannemezan smelter. The modernization, which would increase the 63,000-ton-per-year capacity by 1% and reduce fluoride emissions by 50%, was scheduled to start in 1976.

PUK operated its smelters at 6% below rated capacity during 1975. Stocks during that period more than doubled, from 60,000 tons at the end of 1974 to 130,000 tons at the end of 1975.

Germany, Federal Republic of.—Kaiser acquired the remaining 50% interest in the Kaiser-Preussag A.G. (Kapal) fabricating facilities. Kaiser announced plans to take the full production of the primary aluminum smelter at Voerde and reportedly held an option to acquire the remaining interest in that operation.

Hamburger Aluminium-Werke GmbH operated the 110,000-ton-per-year smelter in Hamburg under a 22½ year installment agreement whereby Reynolds Aluminium Deutschland, Inc., Vereinigte Aluminum-Werke AG, and Vereinigte Metallwerke Ranshofen-Berndorf AG would eventually own the plant.

Leichtmetall GmbH sought to sell its 50% interest in the Essen smelter. Gebrueder Giulini GmbH announced that it was looking for partners in the operation of its 50,000-ton-per-year smelter at Ludwigshafen.

Ghana.—The fifth potline at the Volta Aluminium Co. Ltd. plant at Tema was under construction at an estimated $65 million cost. Upon completion in 1976, the smelter would have a rated capacity of 220,000 tons per year. The Volta River Authority agreed to supply additional power.

Greece.—Agreement was reached between Aluminium de Grece SA, which operated a primary smelter at Distomon, and the Grecian Electricity Co. (DEI) to increase the price for power to 4.375 mills per kilowatt-hour for the original structure of the smelter facility and to 13 mills per kilowatt-hour for power supplied for expansions.

India.—The first stage of the Bharat Aluminium Co. smelter at Korba, Madhya Pradesh, came onstream with an initial capacity of 28,000 tons per year. The plant, which utilized Soderberg cells, was built with Soviet and Hungarian assistance and was scheduled to reach a capacity of 110,000 tons per year by 1980.

A feasibility study was underway for a 22,000-ton-per-year aluminum smelter in the Kolhapur district of Maharashtra. The facility, which would draw on bauxite deposits in the district, was projected to reach a capacity of 110,000 tons per year.

Discussions between the Central Indian Government and Andhra Pradesh and Orissa State Governments were underway for an alumina-aluminum complex at Vishakapatnam. Bauxite from Orissa and Galikonda would be used.

Indonesia.—Nippon Asahan Aluminum Co. was formed to build a 225,000-ton-per-year aluminum smelter in Northern Sumatra. The company was comprised of the Overseas Economic Cooperation Fund, a Japanese governmental agency, with a 50% interest, and 12 Japanese firms including Nippon Light Metal Co. Ltd., Sumitomo Chemical Co., Ltd., Mitsubishi Chemical Industries Ltd., Showa Denko K.K., and Mitsui Aluminum Co. Ltd. The P. T. Indonesian Asahan Co., owned 10% by the Indonesian Government and 90% by Nippon Asahan Aluminum Co., was scheduled to be formed in 1976 to construct the smelter and hydroelectric facility. The first 75,000-ton-per-year stage of the aluminum plant was scheduled to come onstream in 1981, with full capacity expected in 1983.

Iran.—Plans were announced to expand the Iranian Aluminium Co. (IRALCO) smelter at Arak from 55,000 tons per year to 132,000 tons per year. IRALCO also announced that a feasibility study was underway in conjunction with Alumax, Inc., for a second smelter in Iran.

Italy.—The primary aluminum smelters operated by the State corporation Ente Participazione Finanziamento Industria Manifattura (EFIM) functioned at about 60% of their rated capacity of 303,000 tons per year owing to decreased domestic demand.

Japan.—Sumitomo Toyo Aluminium Smelting Co. began operations at its Shikoku, Toyo, plant. The capacity of the plant, which used the Sumitomo Soderberg cells, was 60,000 tons per year, and plans called for expansion to 100,000 tons per year by 1976. The firm was a subsidiary of Sumitomo Chemical Co., Ltd.

Sumikei Aluminium Industries, a subsidiary of Sumitomo Light Metal Industries Ltd., announced that it was going ahead with construction of a 90,000-ton-per-year smelter at Sagata. Initial production was believed to be possible by late 1976. Alumina for the plant, which would be doubled in capacity by 1980, would be supplied by Australian refineries.

Mitsui Aluminium Co. Ltd. started up the first 40,000-ton-per-year potline of its expansion at the Miike, Omuta, smelter. A second 43,000-ton-per-year line was under construction.

Construction on the Furukawa Aluminum Co. Ltd. smelter was scheduled to start by mid-1976 with startup scheduled for 1979. The 77,000-ton-per-year facility would use alumina supplied by Alcoa of Australia Ltd. Alcoa owned 33% of the company, and C. Itoh & Co. Ltd. reportedly acquired a 12.5% share in Furukawa. C. Itoh had sole trading rights in Japan for alumina produced by Alcoa of Australia Ltd.

Construction on the 100,000-ton-per-year expansion of the Showa Denko K.K. plant at Chiba continued, and one 50,000-ton-per-year potline was completed. Startup of the potline was delayed until 1976. Showa Denko established a new subsidiary company, Showa Denko Chiba, to operate the facility.

Mitsubishi Chemical Industries Ltd. announced that 16 of the 144 cells under construction at its Sakaide smelter were operational. The smelter capacity was to have been expanded to 110,000 tons per year by the end of 1975, but expansion was delayed due to decreased demand.

Korea, Republic of.—PUK announced plans to double the capacity of the Aluminium of Korea Ltd. smelter at Ulsan to 40,000 tons per year by 1977. A second expansion was scheduled to raise capacity to 79,000 tons per year by 1979.

A second smelter at Ulsan was under consideration by the South Korean Government. Startup of the 110,000-ton-per-year smelter was scheduled for 1978.

Mexico.—Plans continued for a second smelter with a capacity of 120,000 tons per year to be constructed at Vera Cruz. A 900,000-ton-per-year alumina refinery to be built in Jamaica would supply the required raw materials. Planned ownership of the $400 to $500 million complex was Mexico 51%, Jamaica 29%, and Reynolds 20%.

Netherlands.—Alcan purchased 24.9% of Hunter Douglas, N.V. Hunter Douglas operated a primary smelter at Vlissingen in conjunction with Pechiney. Plans were announced to expand the smelter to 280,000 tons per year at an estimated cost of $114 million. Construction was scheduled to start in 1977.

New Zealand.—New Zealand Aluminium Smelters Ltd. announced plans to commission the 42,000-ton-per-year expansion of the Bluff smelter in 1976. The $48 million project would raise the capacity of the plant to 165,000 tons per year.

Nigeria.—Construction of a primary aluminum smelter was under consideration. Alumina from Jamaica would be used.

Norway.—The Norwegian Government bought Alcan and British Aluminium Co., Ltd. shares in Det Norske Nitridaktieselskap A/S (DNN) for $35 million. DNN operated a 27,000-ton-per-year smelter at Tysseldal.

ASV announced plans to modernize smelters at Årdal, Høyanger, and Sunndalsora. The program would raise ASV capacity to 385,000 tons per year by 1985.

Startup of the third potline at the Lista Aluminiumverk A/S smelter was postponed until 1976. The 26,000-ton-per-year expansion would raise the plant capacity to 88,000 tons per year.

Norsk Hydro purchased primary aluminum smelting technology from Sumitomo Chemical for use at its Karmøy smelter. The process involved 40,000-ampere Soderberg cells and reportedly used 20% less energy than present cells at Karmøy.

Paraguay.—Reynolds Metals Co. announced a feasibility study for a 310,000-ton-per-year aluminum smelter expected to cost about $700 million. Power for the facility would be supplied by a hydroelectric plant already under construction.

Philippines.—Reynolds undertook a feasibility study for a 140,000-ton-per-year aluminum smelter and a 755,000-kilowatt hydroelectric plant on Mindanao Island. Reynolds owned 51% of Reynolds Philippine Corp., a fabricating company which produced sheet, foil, and extrusions.

Saudi Arabia.—The Government-owned company Petromin announced plans to construct a 230,000-ton-per-year smelter within the next 5 years. Sumitomo would provide the technology.

Spain.—Ground clearing started for the Aluminio Español alumina-aluminum complex at San Cipriano, Lugo. The plans included a 175,000-ton-per-year smelter and an 880,000-ton-per-year refinery to come onstream in 1977 and 1978 respectively. Bauxite for the refinery would be imported from Guinea.

Alumínio de Galicia S.A. (Alugasa) announced plans to expand its 15,000-ton-per-year smelter at Sabinanego with technical assistance by Pechiney. Plans also were announced to expand the La Coruña smelter to 106,000 tons per year by 1978.

Sweden.—Gränges Aluminium AB announced plans to expand the Sundsvall plant from 95,000 tons per year to 145,000 tons per year.

Taiwan.—The Taiwan Aluminium Corp. 35,000-ton-per-year expansion at its Kaohsiung smelter was scheduled to begin operations in 1976. Announced expansion plans would raise capacity to 99,000 tons per year by 1979.

U.S.S.R.—The new Regar smelter in the Republic of Tadzhikstan reportedly began trial operation. It was also reported that equipment problems could delay the production level from reaching designed capacity until 1977. Power was supplied by the Nurek hydroelectric project.

Negotiations continued with Pechiney to construct a primary smelter and an alumina refinery in Siberia. Kaiser also sent a delegation to the Soviet Union to discuss possible smelter construction contracts.

United Kingdom.—Kaiser increased its share in Anglesey Aluminium Ltd. to 66.7%, and Rio Tinto-Zinc Corp. Ltd. decreased its share to 33.3%. British Insulated Calender Cables was no longer a shareholder in the company.

Venezuela.—Alumínio del Caroni S.A. (Alcasa) obtained a $70 million loan from Fondo Inversiones for the 70,000-ton-per-year expansion of its Ciudad Guyana smelter. The smelter capacity was scheduled to be increased to 125,000 tons per year by 1978. The remainder of the estimated $200 million expansion cost would be financed by the private sector.

Land clearing for the New Venalum 77,000-ton-per-year smelter began, and startup was rescheduled for 1978. Ownership of the facility consisted of Corporacion Venezolana de Guyana (CVG) 80%, Showa Denko K.K. 7%, Mitsubishi 4%, Kobe Steel 4%, Sumitomo 4%, and Marubeni 1%. Plans called for eventual expansion to 280,000 tons per year.

Zaire.—Alusuisse and the Government of Zaire announced plans for a 175,000 to 220,000-ton-per-year smelter to be located near Banana on the Congo estuary. Bauxite for the facility would be supplied by reserves to be developed in the Inga-Sumbia region. Power was to be supplied by the Inga hydroelectric facility.

TECHNOLOGY

Battelle Columbus Laboratories, under contract to the Bureau of Mines, estimated the energy rquirements for all phases of the aluminum production process.[3] Energy values of raw materials, transportation, byproducts, and waste products were included in the average energy use for the United States of 243.9 X 10^6 British thermal units (Btu) per ton of aluminum. Energy inputs for the transportation of imported bauxite were based on 1973 statistics with the imports from each of the exporting countries distributed proportionately on a ton-per-mile basis.

Energy required for bauxite mining, transportation, crushing, washing, screening, and drying was estimated at 4.79 X 10^6 Btu per ton of aluminum. The Bayer process was estimated to use 42.6 X 10^6 Btu per ton of aluminum. Production of carbon anodes required 20.86 X 10^6 Btu per ton of aluminum, and the manufacturing process for carbon cathodes required 1.21 X 10^6 Btu per ton of aluminum. The aluminum reduction process required 174.47 X 10^6 Btu per ton of aluminum, on the assumption that the electricity used was thermally generated, using 10,500 Btu per kilowatt-hour. Since about 40% of the electricity used by the aluminum industry was based on hydropower, total actual use was about 204 X 10^6 Btu per ton of aluminum.

---

[3] Battelle Columbus Laboratories. Energy Use Patterns in Metallurgical and Nonmetallic Mineral Processing (Phase 4—Energy Data and Flowsheets, High-Priority Commodities). Battelle Columbus Laboratories (Columbus, Ohio), June 27, 1975, 172 pp., available from National Technical Information Service, Springfield, Va., PB 245 759.

Energy requirements of 0.81 X 10^6 Btu per ton of aluminum for pollution controls were also included in the total. Total energy use in this area included 0.59 X 10^6 Btu per ton of aluminum for control of the emissions from reduction cells and carbon bake furnaces, 0.04 X 10^6 Btu for dust control in the Bayer plant calciner, and 0.18 X 10^6 Btu for miscellaneous operations within the production process. Battelle projected the total industrywide energy consumption for pollution controls by 1980 at 1.90 X 10^6 Btu per ton of aluminum, with control of emissions from reduction cells and the carbon plant accounting for 1.77 X 10^6 Btu per ton of aluminum.

The International Primary Aluminium Institute released data on capital and operating costs to achieve various levels of control of fluorine emissions from reduction cells.[4] The data on emission and costs were based on answers to a detailed questionnaire sent to member companies.

Sumitomo Toyo Aluminium Smelting Co. began operation of an improved procedure for Soderberg cells.[5] The procedure, which was used in all of Sumitomo's Soderberg processing plants in Japan, reportedly reduced power consumption by 15% to 20%, nearly doubled cell life, and cut emissions of hydrocarbon smoke by 50% and fluoride gases by 40%. The Sumitomo cell minimized voltage fluctuations by altering the heat balance through the cathode, reduced fluoride emissions by improving the crust-breaking operation, and cut emissions of hydrocarbons from the self-baking anodes by changing the design and composition of the anode.

A report described methods for improving energy utilization of aluminum-melting furnaces by maintaining an appropriate fuel-to-air ratio, by reducing the infiltration of cold air into the furnace, and by careful planning of charging and production cycles.[6] Methods for distributing the flame and placing the burner in the furnace for maximum efficiency also were described, as were the energy savings made possible by recirculating partially burned exhaust gases.

The Environmental Protection Agency finalized pollution control requirements for aluminum smelters under construction or being modified as of October 23, 1974, effective January 26, 1976.[7] The regulations required removal of 95% of the fluoride emissions before air is released from the stacks. Emissions from prebake plants were limited to 1.9 pounds of fluoride per ton of aluminum and from Soderberg plants to 2.0 pounds per ton. Opacity of the emissions was limited to 10% at both types of plants.

Fluorine emissions from anode bake plants were limited to 0.1 pound per ton of anodes produced. Opacity of the emissions from bake plants was limited to 20%. Emission control guidelines for existing aluminum reduction and anode bake plants were under study.

The recovery and recycling of fluorides from the alumina reduction process in relation to the operation of the electrolytic cell was studied.[8] Surplus cryolite was believed to be formed when the Na_2O content of the alumina used in the cell exceeded 0.8%. Since recovery of fluorine from pot gas emissions by dry absorption forms significant quantities of aluminum fluoride, it was postulated that recycling cryolite from used potlinings would help to maintain an appropriate balance of electrolyte constituents.

Relatively pollution-free processes to reduce the magnesium content of molten aluminum to less than 0.1% by halogenation were discussed.[9] It was stated that the process by which the magnesium is reacted with a halogen, such as chlorine, to produce magnesium chloride, which floats to the surface and can be removed, could be 100% efficient if physical contact of the reactants is prolonged to provide time to react with the magnesium and if the aluminum chloride formed in the process is contained within the metal before it reaches the bath surface. Several processes to accomplish these objectives were discussed.

A magnetic device, which could be used to separate 150 pounds per hour of aluminum from 20 tons of raw municipal refuse, began operation at the National Center For Resource Recovery in Washington, D.C. The magnet, which operates on the eddy current principle, repels aluminum scrap by utilizing the electrical polarity induced in the aluminum by a magnetic field. Aluminum scrap recovery from municipal waste was under study at Franklin, Ohio, where a new system, also based on the eddy current principle, could separate 60 to 250 pounds of aluminum per hour.[10] Similar studies were underway in Baltimore County, Md., where continuous separation is based on Bureau of Mines technology.[11]

An updated economic evaluation of the Bureau of Mines process for separating aluminum and other materials from incinerator residues was published.[12]

The separation of metals and other materials in an automobile for cryogenic fragmentation was under development by George et Cie. of Belgium.[13] In this process, called the Inchscrap process, up to 30 tons of automobiles are recycled per hour. The cars are compressed into rectangular bales, and liquid nitrogen, 196° C below zero, is used to embrittle the materials, which are then fed into a fragmentizer which shatters steel and other metal components and rubber and plastic materials into gravel-size pieces. The aluminum and other components are separated from the fragmentized automobile by conventional classification techniques based on size, density, and magnetic properties.

Previous Bureau of Mines investigations demonstrated the usefulness of low temperatures to improve grinding results and subsequent separation of mixed wastes.[14]

Antimony

By John A. Rathjen [1]

With the exception of domestic mine production, all phases of the U.S. antimony industry during 1975 operated at lower levels than in 1974. A drop in consumption to 12,987 tons, the lowest recorded usage since 1961, was attributed generally to adverse economic conditions. Smelter and secondary metal production along with imports and exports also declined, but industry stocks reached a record high in 1975.

Domestic mine production rose for the third consecutive year. The slow but steady recovery of mine production was due to rehabilitation of the Sunshine mine in Idaho, which was damaged by a serious fire in 1972, and to increased output at the Babbitt mine in Montana.

Depressed economic conditions were reflected in the New York price quotation, which averaged 204.49 cents per pound during the first quarter, but dropped rapidly to 160.00 cents per pound in the second quarter, where it remained for the balance of the year.

DOMESTIC PRODUCTION

MINE PRODUCTION

Total domestic mine production of antimony in 1975 rose to 886 tons, an increase of 34% over the 1974 output. All antimony mined was from Idaho and Montana; properties in Alaska, California, and Nevada remained inactive throughout the year. The Sunshine mine, operated by the Sunshine Mining Co. in the Coeur d'Alene district of Idaho, was the largest producer with 613 tons of antimony produced in ore during 1975. This output represents a 78% increase from the low level of production in 1972 when operations were curtailed by a serious mine fire. The principal antimony ore mineral mined in this district is tetrahedrite, a complex silver-copper-antimony sulfide.

The U.S. Antimony Corp. at Thompson Falls, Mont., continued its expansion program at the Babbitt mine-mill-smelter complex. Mine output during 1975 was 273 tons of antimony in ore, an increase of 104 tons above the 1974 production. The principal antimony mineral from the Babbitt mine is stibnite, the most common of the antimony ore minerals.

---

[1] Mineral specialist, Division of Nonferrous Metals.

Antimony recovered as a byproduct in smelting of domestic lead concentrates dropped to 268 tons in 1975, down from 658 tons recovered in 1974. This decrease in production of antimonial lead from domestic ores was attributed to a changeover in basic smelter feed.

Table 2.—Antimony mine production and shipments in the United States
(Short tons)

Year	Antimony concentrate	Antimony	
		Produced	Shipped
1971	4,721	1,025	1,073
1972	2,072	489	547
1973	2,468	545	494
1974	3,217	661	593
1975	4,505	886	966

SMELTER PRODUCTION

Primary.—Overall smelter production of primary antimony products in 1975 was 12,189 tons, 27% less than in 1974. A small gain of 7% in production of primary antimony metal was exceeded by significant losses in output of oxide, sulfide, residues, and byproduct metal. The sharpest decrease was in production of antimony oxide, which dropped to 7,890 tons, a loss of 24% from the comparable output in 1974. Most of this decline was due to lower demand, although imports of oxide from the Republic of South Africa displaced some domestic production.

Antimony metal was produced by NL Industries, Inc., at its Laredo, Tex., smelter, Sunshine Mining Co., at its electrolytic operation in Kellogg, Idaho, U.S. Antimony Corp. at its smelter in Thompson Falls, Mont., and Intermountain Smelting Corp. at Salt Lake City, Utah. The major producers of antimony oxide were ASARCO Inc. at Perth Amboy, N. J., Chemetron Corp. at Cuyahoga Heights, Ohio, Harshaw Chemical Co. at Gloucester City, N. J., and M & T Chemicals Inc. at Baltimore, Md.

Table 3.—Primary antimony produced in the United States

1973	15,455	731	412	24	1,167	7.6
1974	12,513	658	404	35	1,097	8.8
1975	6,029	268	182	117	567	9.4

[1] Includes primary residues and a small quantity of antimony ore.

[2] Includes foreign base bullion and small quantities of foreign antimony ore.

Secondary.—Scrap lead recycled at primary and secondary lead plants in 1975 produced 17,964 tons of antimony as a coproduct. This represents a decline of 5,600 tons from the level of 1974 and reflects the slow rate of secondary activity during the year. Most of the antimony was generated from battery scrap (66%), with the balance coming from various materials including drosses, residues, type metal, old bearings, and other items. Antimonial lead recovered through this process is alloyed to specific assay requirements and resold directly to consumers. In the future, as new battery systems are developed, it is believed that more antimony will be produced in the form of pure metal.

Table 5.—Secondary antimony produced in the United States, by kind of scrap and form of recovery

(Short tons, antimony content)

Kind of scrap	1974	1975
New scrap:		
Lead-base	2,950	1,905
Tin-base	43	39
Total	2,993	1,944
Old scrap:

Tin-base	16	13
Total	20,577	16,020
Grand total	23,570	17,964

Form of recovery	1974	1975
In antimonial lead[1]	18,963	14,768
In other lead alloys	4,597	3,187
In tin-base alloys	10	9
Total	23,570	17,964
Value (millions)	$85.7	$63.4

[1] Includes 35 tons of antimony recovered in antimonial lead from secondary sources at primary plants in 1974 and 117 tons in 1975.

CONSUMPTION AND USES

Domestic consumption of antimony in 1975 dropped to 12,987 tons, a decline of 28% from the 1974 level. All of the consuming categories were down with the largest drop in use for metal products which totaled 5,647 tons, 2,782 tons less than in 1974. Use of antimony in nonmetal products and flameproofing chemicals combined was 7,340 tons, a decline of 24% from the corresponding total in 1974. Overall, the use of antimony for specific applications decreased in relative proportion to low demand. The one exception was consumption by the battery industry, which declined from 7,251 tons in 1974 to 4,568 tons in 1975. The reason for this drop in use was attributed partly to the production of maintenance-free automotive batteries that utilize a calcium-tin alloy as a substitute for antimony in the grid system.

Use of antimony trioxide in flame retardants did not grow as expected in 1975, as consumption declined approximately 13% to 3,799 tons. This decline was considerably less than the general downturn, however, and it is anticipated that future growth in this use category may offset projected losses in antimony used in the battery industry.

The various compounds of antimony such as sodium antimonate, antimony pentachloride, antimony pentasulfide, and others, continued to find application in the glass, ceramic, rubber, and paint industries.

Table 6.—Industrial consumption of primary antimony in the United States

STOCKS

Industry stocks of antimony continued to climb for the third consecutive year, reaching a record high of 14,957 tons at the end of 1975. Antimony contained in ores and concentrates, the largest gain, totaled 8,364 tons, an increase of 33% compared with the yearend 1974 level. Inventories of metal, oxide, residues and slags, and primary antimonial lead also increased from the 1974 level. The overall rise was due primarily to the decrease in demand during the year.

Table 8.—Industry stocks of primary antimony in the United States, December 31

[1] Inventories from primary sources at primary lead refineries only.

PRICES

The general decline in demand in world markets during 1975 precipitated a downturn in prices for antimony products. The quoted sale price for RMM antimony metal, New York basis, was $2.25 per pound at the beginning of 1975. On January 20, the quotation was dropped to $1.99 per pound; May 19, to $1.75 per pound; and on June 1, the price was posted at $1.60 per pound, where it remained for the balance of the year. The price for foreign antimony metal, ex-dock New York, was quoted from a high of $2.00 to a low of $1.30 per pound. With the European free-market prices under parity during 1975, a discount situation prevailed. Antimony trioxide also declined in value during 1975, dropping in price from $2.16 per pound at the beginning of the year to $1.65 per pound at yearend. The quoted price for lump ore, on a 60% antimony basis, reflected reduced demand levels, and decreased from a range of $32 to $33 in January to a range of $17 to $18 per short ton unit c.i.f. in December.

Table 9.—Antimony price ranges in 1975

Type of antimony	Price per pound
Domestic metal [1]	$1.58–$2.28
Foreign metal [2]	1.30– 2.00
Antimony trioxide [3]	1.65– 2.16

[2] Duty-paid delivery, New York.
[3] Quoted in Metals Week.

FOREIGN TRADE

Exports of antimony of all classes in 1975 declined to a total of 628 tons, a drop of 57% from the 1974 level. Antimony metal exports, in the form of pure metal, alloy, or scrap dropped to 340 tons in 1975 compared with 871 tons in 1974. Four countries received 80% of the total metal exports; the United Kingdom (28%), the Netherlands (26%), Canada (14%), and Italy (12%). The balance was distributed evenly among nine other countries. Exports of antimony oxide also declined to 288 tons, a decrease of 305 tons from 1974 shipments. Approximately 50% of the total was shipped to Canada; the balance was shipped in small parcels to about 18 countries.

Imports of antimony in all forms during 1975, in terms of metal content, were 18,706 tons, a decrease of 15% from the 1974 total. With the exception of antimony oxide, receipts in all categories were lower than in 1974. The sharpest drop was antimony contained in ores and concentrates, which decreased 43% from 1974. The pattern of ore shipments changed during the year, with 10 countries supplying the total requirement compared with 18 countries during 1974. Canada, Guatemala, and Mexico cumulatively increased shipments by 1,598 tons; however, this gain was was more than offset by decreased shipments from Bolivia, Chile, and the Republic of South Africa, which together shipped 6,359 tons less than in 1974. Imports of metal in 1975 dropped slightly to 2,112 tons, a loss of 91 tons from the 1974 total. Supply lines were unchanged from earlier years with reduced shipments of metal from Japan, Mexico, and Yugoslavia essentially balanced by increased tonnages from Belgium-Luxembourg, Italy, Thailand, and the United Kingdom.

Imports of antimony oxide rose 58% above the 1974 receipts to a total of 9,908 tons. Increased shipments were received from the People's Republic of China, Taiwan, and Hong Kong, but receipts from the Republic of South Africa, totaling 6,587 tons, were more than eight times imports in 1974. This unusually high gain in shipments was attributed to full operation of new "value added" facilities that upgraded stibnite ore to an 83% antimony oxide product for refining elsewhere.

WORLD REVIEW

World mine production in 1975 dropped slightly to 74,802 tons, a decrease of some 4,500 tons from 1974. No major changes occurred in distribution of output by countries. Moderate increases in production by Canada, Mexico, and the Republic of South Africa were offset by small decreases in Bolivia, Italy, Yugoslavia, and Thailand.

Australia.—Production of antimony in Australia continued along traditional lines during 1975 as several new properties were readied for startup. Silver Valley Minerals NL, concentrated activity at its new mine near Armidale, New South Wales. Underground development was completed, delineating a high-grade deposit that also contains gold. When the mine goes into production, it is expected that ore will be treated at the company's nearby Tulloch plant.

Australian Antimony Corp. NL began production at its new mine at Dorrigo on the north coast of New South Wales. About 103 tons of antimony concentrate was produced before putting the mine on a care and maintenance basis for economic reasons.

Metramor Minerals Ltd., in a joint venture with Australian Anglo-American Ltd., continued development of the Blue Spec antimony mine near Nullagine in the Pilbara district. Sampling to date has outlined 80,000 tons of proven ore reserves assaying 4.63% antimony.

Bolivia.—Bolivia with about 13,002 tons of antimony ranked as the world's second largest producing country during 1975. Recent changes have restructured the industry along the following lines. Banco Minero de Bolivia, a State-owned company, acts as a buying agent for small- and medium-size mines, providing them with a market outlet and centralized source of revenue. Banco Minero in turn, resells the ore or concentrates to either the Bolivian antimony smelter or consumers in the world market.

Empresa Minera Unificada S.A. (EMUSA), a privately owned company, produced antimony ore and concentrate for export as well as consumption in Bolivia. Some of the larger properties included the Chilcobija, Caracota, and Espiritu Santo mines.

Empresa Nacional de Fundiciones (ENAF) in consort with Corporación Minera de Bolivia (COMIBOL) operated an antimony smelter at Oruro, with capacity of 5,000 tons of metal and 1,000 tons of oxide per year. Plans for future expansion are being evaluated in 1975.

China, People's Republic of.—The People's Republic of China was believed to be the third largest producer of antimony in 1975, with an estimated mine production of 13,000 tons. Probably 6,000 to 8,000 tons was exported as metal and in ores and concentrates. Most of the antimony mined in China comes from the Province of Hunan, which is reported to contain about 60% of the total Chinese reserve.

Mexico.—Mexican production of antimony in 1975 increased about 30% to 3,460 tons compared with 1974 production. Deposits of antimony have been identified in 14 States; however, production in 1975 was primarily from the State of San Luis Potosi. Most of the antimony mined in Mexico was shipped to Laredo, Tex., for smelting and refining at the plant of NL Industries, Inc.

South Africa, Republic of.—Production of antimony during 1975 totaled about 17,500 tons. The major producer was Consolidated Murchison Ltd., which operated a mine and processing plant in the Letaba district of the Transvaal and produced about 16,200 tons of antimony. Output was in the form of cobbed ore and antimonial and arsenical concentrates which assayed about 59% to 60% antimony. A significant portion of the concentrates was treated at the crude oxide plant of Antimony Products Pty. Ltd. located near the mine. Antimony Products upgraded the raw material to a crude oxide, which was exported for further refining.

Thailand.—Thailand produced approximately 3,450 tons of antimony during 1975, a slight decline from 1974, reflecting a lack of demand from consuming markets. There was a total of 50 antimony mine lease holders in 1975, 33 of which were located in the northern region. The Provinces of Olampang and Phrae appear to have the greatest potential, but development has been hampered by high production costs and low economic return.

e Estimate. p Preliminary. r Revised.

[1] Antimony content of smelter products, excludes output from New Brunswick, which is believed to be small.

[2] Antimony content of ores for export plus antimony content of antimonial lead and other smelter products produced.

[3] Production by COMIBOL plus exports of medium and small miners.

[4] Total exports.

[5] Antimony content of antimony concentrates, lead concentrates and zinc concentrates.

TECHNOLOGY

A new procedure for preparing high-purity antimony as related to production of high-purity antimony trioxide was discussed.[2] Application might be in the electronic and computer industries as a semiconductor component.

Interaction of antimony oxide with certain other elements was presented as a concept for improved performance with molybdenum disulfide in specialty lubricants.[3]

Asbestos

By Robert A. Clifton [1]

Shipments of asbestos from mines in the United States decreased 12% from those in 1974. There was no decrease in demand for domestic asbestos; all the operating mines were producing at capacity. The decrease in total production was because mines that closed in 1974 had some production that year before closing. Imports were only 70% of those in 1974. The Canadian strike was the principal causative agent for this, but demand also dropped some during the recession.

Canada relinquished, at least temporarily, its claim as the world's primary producer of asbestos. Canadian 1975 production was only 63% of that in 1974 and its shipments to the U.S. only 68% of those in 1974. Imports from the U.S.S.R. were nearly 2% of the total U.S. imports.

r Revised.

[1] Measured by quantity produced, plus imports, plus stockpile release, minus exports.

Legislation and Government Programs.—The event of 1975 with the most potential for impact on the asbestos industry was the proposed regulations published by the Office of Safety and Health Administration (OSHA) on October 9, 1975, in the Federal Register. The proposal contained no mandatory effective date. The most important change in the regulations as proposed would be a reduction in the level of permissible exposure to 0.5 fiber per cubic centimeter of air on a time-weighted average over an 8-hour day. The present permissible level is 5.0 fibers per cubic centimeter due to drop to 2.0 fibers on July 1, 1976.

The proposal excluded those activities where exposure came during construction and provides additional requirements for regulated areas, employee rosters, hygiene facilities, training and information programs, labels and signs, and monitoring and medical surveillance programs.

The asbestos industry applied for and received an extension of the closing time for receipt of comments and raised strong objections to the proposed regulations.

Less than a week after the publication of the OSHA proposal, the Environmental Protection Agency (EPA) promulgated, on

---

[1] Physical scientist, Division of Nonmetallic Minerals.

October 14, new air pollution control regulations. These require generators of asbestos-containing wastes to dispose of them in sanitary landfills. Inactive sites are now regulated and owners must provide such sites with 6 inches of vegetated cover or 2 feet of cover without vegetation. Incineration of asbestos containers is permitted provided that there are no visible emissions.

Drawdown of stockpile inventories continued as shown in table 2. Crocidolite stocks are practically depleted, and there was at least a temporary stop to chrysotile releases.

On September 25 the House of Representatives voted down (209 to 187) H.R. 1287, which would have repealed the Byrd Amendment that permits U.S. purchases of Rhodesian asbestos.

Total	XX	60,679	53,802	6,877

XX Not applicable.

Environmental Impact.—It is impossible to completely assess the impact on the asbestos industry of environmental regulations. The market shortages occasioned by the Canadian strike, when coupled with increasing regulation, intensified the efforts of several companies to find substitutes for asbestos in their products. The return of a normal market situation may indeed indicate that some market segments are lost to asbestos.

The effects of environmental regulations on the asbestos mining industry are still hard to judge. The Vermont Asbestos Group Inc., expects to be in full compliance with EPA regulations in the spring of 1976 without undue economic hardship. A group of West German and American investors bought and is refurbishing the Copperopolis, Calif., mine closed in 1974 by H. K. Porter Co., Inc. This group, Calaveras Asbestos Ltd., fully expects to operate profitably under full compliance.

DOMESTIC PRODUCTION

U.S. mines shipped only 88% as much asbestos in 1975 as in 1974. The value was 3% higher than the 1974 amount. Four States produced asbestos; California was the leader, followed in order by Vermont, Arizona, and North Carolina. Total output was 98,654 tons valued at $14,220,000.

The California segment of the asbestos industry again reported a decline in production. The full effect of the closing of the Coalinga Asbestos Co.'s Christie mine and that of the Pacific Asbestos Corp. mine was felt in 1975. These mine closures resulted in a production of only 97% of the 1974 State total. However, an increase of 6% over the 1974 dollar value of the fiber was realized. By yearend Calaveras Asbestos Ltd. was successful in the acquisition of the Pacific Asbestos mine. Production was scheduled to begin early in 1976. Yearend mining was limited to the Joaquin Ridge near Coalinga with Atlas Asbestos Corp. working its Santa Cruz mine in Fresno County and Union Carbide Corp. operating its Santa Rita mine in San Benito County.

The Vermont Asbestos Group Inc. mine in Orleans County, Vt., remained the U.S. asbestos mine with the highest production, although its output decreased significantly from that in 1974. This mine was scheduled for closure by GAF Corp. in March of 1975 but was purchased by an employee group, which has been highly successful ir efforts to keep it operating. Arizona prc duction in 1975 was 62% above the 197 level. The Jaquays Mining Corp. mine i Gila County was the only active asbestc mine in the State. The mine of North Carolina's Powhatan Mining Co. was inactive, but some 540 tons of anthophyllite were mined and shipped from somewhere in the United States in 1975. Indications are that it was from North Carolina. U.S. asbestos producers and mine sites follow:

State and company	County	Name of mine	Type of asbestos
Arizona: Jaquays Mining Corp	Gila	Chrysotile	Chrysotile.
California:			
Atlas Asbestos Corp	Fresno	Santa Cruz	Do.
Calaveras Asbestos Ltd.[1]	Calaveras	Copperopolis	Do.
Union Carbide Corp	San Benito	Santa Rita	Do.
North Carolina: Powhatan Mining Co.[2]	Yancey	Hippy	Anthophyllite.
Vermont: Vermont Asbestos Group Inc.	Orleans	Lowell	Chrysotile.

[1] Closed during 1975; due to open early 1976.
[2] Inactive.

CONSUMPTION AND USES

Further analysis of the data available from the 1974 asbestos consumption survey reveals that 18,000 tons of asbestos were released from industry stocks and not replaced during 1974 and that the true (rather than apparent) consumption figure for that year would be 864,000 tons. Industry stocks at the end of 1974 were 103,000 tons.

Analysis of the 1975 consumption data reveals the fact that in spite of the very real shortages of 1975, industry stocks were slightly higher at yearend than at the beginning. True consumption would be somewhat less than 600,000 tons.

Comparisons between the end uses for 1974 and 1975 would seem to be an exercise in futility because of the inability to distinguish between decreased asbestos product production caused by fiber shortage and that caused by economic recession. It is extremely interesting to note that "textile fiber" imports in 1975 were only 30% of those in 1974. Whether this is trend indicative or not will have to await data from more normal years.

Table 3.—Asbestos distribution by end use, grade, and type, 1975

(Short tons)

	Chrysotile								Crocido-lite	Amosite	Antho-phyllite	Total asbestos

Coatings and compounds	200	900	800	100	100	29,400	--	31,500	--	--	--	31,500
Plastics	--	200	800	1,000	--	11,700	--	13,700	1,200	--	--	14,900
Textiles	700	5,200	100	100	--	--	--	6,100	--	--	--	6,100
Paper	--	100	5,000	1,400	30,500	28,700	--	65,700	200	--	--	65,900
Other	--	1,300	1,600	2,600	4,700	9,300	--	19,500	--	500	800	20,800
Total	1,100	13,700	110,400	77,800	72,800	294,700	200	570,700	22,700	12,800	1,400	607,600

In 1975 asbestos cement pipe was still the largest single use for asbestos with better than 25% of the consumption. Asbestos cement sheet was the sixth largest use at over 7%. Flooring products at 22% was second. If the near 8% used in roofing products is added to the previously mentioned three uses, these construction industry products still account for nearly two-thirds of U.S. asbestos use. The other major asbestos-containing end products are friction materials at 10.9%, paper at 10.8%, and coatings and compounds at 5.2%. Plastics used better than 2% of the asbestos total.

PRICES

Quoted prices for Quebec asbestos rose more than 23% during 1975 with the last rise effective on December 1, 1975. British Columbia asbestos prices rose more than 30% during the year in two steps, the last one effective August 1, 1975.

Prices for some grades of Arizona chrysotile asbestos were raised on April 17, 1975. Quotations, f.o.b. Globe, were as follows:

Grade	Description	Per short ton
Group No. 1	Crude	$2,000
Group No. 2	do	1,500
AAA		1,100
Group No. 3	Nonferrous filtering and spinning	$715– 800
Group No. 4	Nonferrous plastic and filtering	700– 800
Group No. 7	White shorts	100– 200

As of June 16, 1975, Vermont chrysotile asbestos, f.o.b. Morrisville, was priced as follows:

Grade	Description	Per short ton
4A through 4T	Fiber	$360–$608
5D through 5R	do	238– 280
6D	Waste	173
7D through 7T	Shorts	77– 150
7TF	Floats (shorts)	66
8S	Shorts	53
Hooker No. 1	Packaged in 50-pound woven polyvinyl bags	850
Hooker No. 2	Packaged in 100-pound woven polyvinyl bags	425

Quotations for Canadian (Quebec) chrysotile, f.o.b. mine, were as follows, as of December 1, 1975:

Grade	Description	Per short ton
Group No. 1	Crude	Can$3,496
Group No. 2	do	1,879
Group No. 3	Spinning fiber	Can$891–1,463
Group No. 4	Asbestos-cement fiber	492– 829
Group No. 5	Paper fiber	278– 392
Group No. 6	Waste, stucco, or plaster	236– 244
Group No. 7	Refuse or shorts	89– 198

Prices for British Columbia and Yukon Territory, Canada, chrysotile asbestos were effective August 1, 1975. Quotations, f.o.b. Vancouver, were as follows:

Grade	Description	Per short ton
Cassiar mine:		
C-1	Crude	Can $2,916
AAA	Nonferrous spinning fiber	1,685
AA	do	1,340
A	do	1,020
AC	do	785
AK	Asbestos cement fiber	524
AS	do	454
AX	do	416
AY	do	292
AZ	do	216
Clinton mine:		
CP	do	492
CT	do	445
CY	do	292
CZ	do	216

African asbestos producers privately negotiate sales and this rules out market quotations. The following are averages, regardless of grade, of the values of South African imports, calculated from U.S. Department of Commerce data:

Type	Per short ton				
	1971	1972	1973	1974	1975
Amosite	$164	$187	$188	$228	$395
Crocidolite	212	211	213	251	427
Chrysotile	120	202	234	282	940

The increased demand for and unavailability of asbestos in all categories plus increased mining costs resulted in price increases almost across the board. Other price rises are expected early in 1976.

FOREIGN TRADE

The value of exports of asbestos products manufactured in the United States showed little change from 1974 to 1975. This is noteworthy when numbers of articles exported decreased. There were more than 1,000,000 fewer clutch facings shipped abroad in 1975 than in 1974.

Major groupings of exported products and their share of the total value were friction products (36%), packing and gaskets (20%), asbestos cement products (13%), textiles and yarns (12%), and insulation products (8%).

In 1975, 64% of the cost of imported asbestos was recovered by the exporting and reexporting of fibers and products.

In 1975 the United States imported 89% of its asbestos consumption. This was below the 1974 percentage. Canada provided better than 93% of the imports, the Republic of South Africa provided 3%, the U.S.S.R. 2%, and nine other countries provided the remainder. Chrysotile, with 97%, dominated the imported types. The dollar value of imported fibers was 90% of that in 1974.

WORLD REVIEW

The following quote,[2] from an in-depth article in a Canadian mining periodical, fairly well describes what happened to Canadian production in 1975, which left much of the world demand unsatisfied:

"Inflation, recession, landslides and strikes have contributed to a troubled year for a large segment of the asbestos industry. Environmentalists and the media have damaged the image of this extremely important mineral. In spite of all this, the industry is shaking off the effects of these unforeseen mishaps and conditions and should end the year alive and well—and in a position to resume a normal growth pattern."

"Canada's position as the world's leading producer has not been challenged and there is no serious rival in sight. This is due, for the most part, to the quality of the chrysotile fibre which makes up the bulk of our production, and the high standard of the marketed products."

Another magazine[3] with worldwide distribution and a less parochial viewpoint put this in context with the world supply-demand situation of the last few years when it said at the beginning of its lead article in June:

"In common with many other industrial minerals (and many other commodities), asbestos experienced extremely strong demand throughout 1974, which was reflected in higher prices, shortages in certain areas, and producers operating at capacity levels. This year's recession in Western industry appears to have taken the heat out of the majority of mineral markets, however, with significant falls in both demand and prices. Not so asbestos! Demand continues to exceed supply, and after price rises averaging over 50% between the end of 1973 and the beginning of 1976, yet another rise is expected shortly—and all this even though two of asbestos' major consuming areas—the construction and the motor manufacturing industries—are operating at low levels. This paradox cannot be explained simply. The continuing short supply has in fact been brought about by a combination of factors—producer problems, ranging from a fire and landslide to strikes and other political pressures; supply problems, such as shipping difficulties and the like; and continuing strong demand, particularly from the developing countries. In addition, the whole industry from mining to manufacturing, is undergoing extensive changes as new and wider controls are introduced to counter the much-publicized health hazards associated with asbestos usage."

---

[2] Northern Miner. Asbestos Weathers Storm. V. 61, No. 37, Nov. 27, 1975, p. B–12.

[3] Industrial Minerals. Asbestos. No. 93, June 1975, pp. 19–24, 26–31, 33.

As expected there were significant price increases for asbestos in 1975 led by an approximate 23% rise in the published prices of Quebec fibers.

Australia.—The Woodsreef mine seems to be turning the corner toward solvency. There was very little deficit in the quarter ended October 31, 1975. If production were maintained at that quarter's rate, the annual production of asbestos fibers would near 60,000 tons. The company has identified four other asbestos prospects in New South Wales and applied for exploration licenses for them.

Canada.—Canadian asbestos production (all chrysotile) during 1975 was only 63% of that during 1974. The economic recession of that year was not to blame as producers sold all of their production that was available after a fire, a landslide, and a strike.

The bad year began, actually, in December 1974 when the fire that destroyed the King-Beaver mill of Asbestos Corp. Ltd. in Thetford Mines reduced that company's capacity for fiber production from 150,000 to 100,000 tons per year in that locality. Reserve updating was necessary prior to mill replacement planning. As a strike prevented the needed drilling for 7 months, no decision had been made by yearend. The Asbestos Hill mine of Asbestos Corp. Ltd. in Ungava was not bothered by the Thetford Mines misfortunes. It produced 42% more fiber concentrate than in 1974 and shipped 48% more of the concentrate to the mill at Nordenham, West Germany.

The Jeffrey mine of Canadian Johns-Manville Co. suffered a major landslide in January of 1975, which cut shipments for the year to 93% of the 650,000 tons of fiber shipped in 1974. A return to full production was reached in October with record high shipments and another record was set in December. Although the labor contract between Johns-Manville and their employees expired at approximately the same March date as that of other asbestos producers in the area, the union and management agreed to terms before a strike was called.

In March the 3,500 employees of the four companies producing asbestos in the Thetford Mines area struck for higher wages and better working conditions. Although two unions were representing the workers of Asbestos Corp., Ltd., Bell Asbestos Mines Lt., Carey-Canadian Mines, Ltd., and Lake Asbestos of Quebec, Ltd., they had unanimity of purpose and remained on strike for 7 months. The basic hourly wage rose immediately from $3.73 to $5.21 and to $6.59 by September 1, 1977. The Quebec Asbestos Mining Association estimated that the total package would come to about a 45% to 50% increase over the 2-year tenure of the contract.

Advocate Mines, Ltd., announced the finding of a possible asbestos ore body 12 miles from its Baie Verte operation. Diamond drilling was being expedited.

Cassiar Asbestos Corp. Ltd. started operating a new tramline and primary crusher plant at its Cassiar, British Columbia, mine in September. This mine was also the scene of a 3-week strike in early winter of some 400 workers over health and safety conditions.

At yearend the new mine and mill of United Asbestos Inc. at Midlothian Township in Ontario had reached the tuneup stage. Brinco Ltd. at that time had reached a new $260 million estimate of the capital costs of bringing into production the Abitibi Asbestos Mining Co. property in Maizerete Township, Quebec. It was estimated that it would take 3 years to enter full production once the decision to proceed was made. Evaluation and testing of the Chibougamau, Quebec, deposit of the McAdam Mining Corp. were continued by Rio Algom Limited.

On December 15, Acting Environment Minister Romer LeBlanc announced a federal limit of 2 fibers per cubic centimeter in the air surrounding asbestos mining, milling, and dry rock storage areas. He cited the Clean Air Act as authorization.

China, People's Republic of.—An article in a Chinese newspaper[4] describes the Shiehmien (meaning asbestos) mine in Szechwan Province. The mine is described as having an ore body 6,300 meters long by 350 meters wide containing more than 28 million tons of ore grading over 2%. The use of modern techniques and machinery such as aerial tramways and trucks have increased production from 50 tons to "tens of thousands of tons" (could be per month). The article claims that more than half of the fibers exceed 2 millimeters (0.08 inch) in length. During 1975 China started advertising the availability of such asbestos-containing articles as yarn, packing, lagging, and cloth.

---

[4] Takungpao. Asbestos in Szechwan. Aug. 31, 1974, p. 8.

Cyprus.—The 1973 troubles on the Island failed to disrupt Cyprus' production and export of asbestos. The 1974 export figure was nearly 13% above that of 1973.

Finland.—After 58 years of operation the Paakkila anthophyllite mine of Paaristen Kalkki Oy was closed in January. Marketing problems and labor shortages were among the determining factors. The mill remained open through June. Some African anthophyllite mines have developed grades corresponding to the Finnish ones and these are available on the world market.

India.—With assistance from the United Nations Development Program, a new asbestos processing facility was scheduled to be under construction by late 1975 in India. The site was at the Cuddapah area of Andra Pradesh where there was estimated to be reserves of 27,000 tons.

South Africa, Republic of.—Some intriguing indications are to be found in the preliminary 1975 statement of Griqualand Exploration and Finance Co. (Gefco). Their Kiruman mine in Cape Province is reportedly the world's largest source of blue (crocidolite) asbestos with a nominal 55,000-ton annual production in the last few years. They claim a worldwide shortage of "blue" in spite of no sales in the United Kingdom, a looming ban in Canada, and many environmentalists calling crocidolite the most unhealthy of fibers. Gefco shows an astounding 49% rise in unit cost of production, but it is clear that sales have risen substantially over 1974.

Sweden.—Sweden's industrial health board banned the use of asbestos in building insulation, soundproofing, and most other purposes except fireproofing, effective October 1. Action followed findings that eight lung cancer deaths among workers at the Nohab Machine Works in Trollhattan between 1959 and 1969 were attributable to the fact that Nohab used asbestos as an insulating material for locomotive-engine exhaust pipes.

U.S.S.R.—In 1975, asbestos production (six grades) in the U.S.S.R. passed the 2-million-short-ton mark for the first time, surpassed Canadian production for the first time, and the estimated 600,000 tons exported exceeded Canada's exports for the first time. More than half of the exports were to countries other than those with centrally controlled economies in spite of a domestic deficit of an estimated 110,000 tons.

The U.S.S.R. asbestos industry is centered in the Urals, Kazakhstan, and Tuva A.S.S.R. The Uralasbest complex produced an estimated 1.4 million tons in 1975. In the southern Urals the development of the Kiembayev deposit in Oranburg Oblast continued. This effort, underwritten by seven Council for Mutual Economic Assistance (Comecon) members, has a design capacity of 550,000 tons and the first of two equal construction stages is due to begin operation in 1978. Output will be shared with the participating Comecon members.

Kazakhstan has the U.S.S.R.'s second largest asbestos deposit, Dzhetygara, in Kustanay Oblast. Renovation of the No. 1 mill and commissioning of the new No. 2 mill permitted production of about two-thirds of a million tons in 1975.

The high quality, long fiber, deposit at Aktourak in Tuva A.S.S.R. produced about 38,000 tons of asbestos in 1975.

Design of the complex to exploit the Molodeshny deposit in Buryat A.S.S.R. was completed in 1974, but construction will not be started until completion of the western section of the Kaykal-Amur railroad.

Yugoslavia.—Ore from the Stragari mine of Stragari Asbest located at Stragari, Serbia, was tested in the laboratories of the Mining Institute in Zemun during 1975. The new fiber recovery technology developed is being installed and should be in use in 1976. Design production capacity is 5,000 tons of fiber per year.

[1] In addition to the countries listed, Czechoslovakia, North Korea, and Romania also produce asbestos, but available information is inadequate to make reliable estimates of output levels.

[2] Includes asbestos flour.

TECHNOLOGY

The shortages of asbestos resulting from the Quebec strike, the price increases resulting from this and other inflationary pressures, and the very real problems associated with environmental control of exposure to asbestos put added pressure on the perennial search for asbestos substitutes.

These things were discussed in a national magazine,[5] excerpts from which appear below:

> "Our suppliers have a 'spear your friends' policy," said a midwest friction products manufacturer. "Because of that policy many of our materials costs have doubled in the past 12 months."
>
> A New England producer of packing and seals ". . . is studying the use of Teflon and graphite fibers as substitutes for asbestos. He admits 'for the time being asbestos is still a critical material for this company's products.' "
>
> A midwest boiler gasket producer asserts, "Asbestos is close to pricing itself out of the market. Ceramic materials have been around for some time that would replace asbestos in some applications, but in the past they were too expensive. Now they are looking a lot more attractive."
>
> A western manufacturer tried substituting mineral wool and fiberglass in flooring materials but, "We found there's really no replacement for asbestos."

Although the aforementioned article cited the fears of one asbestos cement pipe manufacturer about the convergence of costs of competing products, there is a factor probably overlooked: Energy. An extract in a trade magazine[6] covers the situation well: ". . . recent statistical evaluations carried out in the United States showed that the production of asbestos-cement pipes required only one-eighth of the energy needed to produce a similar length of cast iron pipes and one-quarter of the energy needed for PVC pipes. In this calculation the entire energy consumption was taken into account, that used in the mining of asbestos, crushing and purifying the ore, transporting it and that of asbestos-cement manufacture up to the factory stockyard."

[5] Business Week. The Seller's Market in Asbestos. No. 2411, Dec. 15, 1975, p. 49.

[6] International Asbestos Cement Review. Asbestos-Cement—An Industry in Decline or Facing Further Expansion. Declan Grehan, v. 20, No. 1, January 1975, pp. 27–30.

That there is still ongoing effort to substitute glass fiber for asbestos in reinforced cement products is evidenced by the recent agreement between Pilkington Brothers Ltd. of England and Owens-Corning Fibreglas Corp. of the United States. Under the agreement Pilkington will share its know-how of its alkali-resistant glass fiber with its American ally.

The Du Pont Corp. is diligently seeking new markets for its aramid fiber "Nomex," which already has wide acceptance in the protective clothing field and some acceptance as a tire fiber.

According to Chemical Engineering[7] the Japanese Government's decision to outlaw mercury cells in chlor-alkali plants has pushed two companies (one presently using Du Pont's Nafion membranes) into developing their own synthetic membrane diaphragms to replace the asbestos diaphragms of the mercury cells. The fast developing technology is apparently economical as well as environmentally preferable. This market for asbestos fibers may be slowly closing.

A whole family of ceramic fibers is now available according to a national magazine[8] and for temperatures above 1,000° F (811 K) they are excellent insulation materials. Some of the newer ones have service temperatures up to 3,000° F (1,922 K). They are lightweight, flexible, longlived, and expensive. Prices range from $.65 to $25 per pound. Typical properties are shown in table 8.

Not all technological advances have been in the area of asbestos substitutes. Raybestos-Manhattan, Inc. announced a processing sequence that keeps asbestos immersed throughout production of its "Novatex" asbestos yarns. This suppresses process dust and contains a binder that will keep the fibers locked in during further processing. The same company has a new British patent on a method of preparation of asbestos containing synthetic yarns.

The Bureau of Mines has developed, at its Boulder City, Nev., Metallurgy Research Laboratory, a new high-strength, corrosion-resistant material composed of asbestos fiber reinforcing silica flour bonded together with plasticized sulfur. It is suitable for handling corrosive liquids such as sewage, acid leach solutions, mine waste water, and salt solutions.

Barite

By Stanley K. Haines [1]

Production of barite increased 16% in 1975 to 1.29 million tons. Nevada produced 71% of the total, with 1975 production in that State increasing 20% over that of 1974. Imports of crude barite decreased 13% to 634,000 tons. The domestic and imported barite was ground and used primarily as a weighting material in oil- and gas-well drilling fluids. Sales of crushed and ground barite for all uses increased 10% to 1.8 million tons. Demand for barite in well drilling muds more than offset decreased demand for other uses.

r Revised.

DOMESTIC PRODUCTION

Producers sold or used 1,287,000 tons of primary barite in 1975. Primary barite is defined as the first marketable product and includes crude barite, flotation concentrates, and other beneficiated material such as washer, jig, or magnetic-separation concentrates.

Barite was produced at 42 mines in 1975; 18 in Nevada, 12 in Missouri, 3 in Tennessee, 2 each in Arkansas and Georgia, and 1 each in Alaska, California, Idaho, Illinois, and Montana. Nevada was the leading State, with 71% of the total quantity and 53% of the total value. The other producing States were, in descending order of production, Missouri, Arkansas, Georgia, Tennessee, Idaho, Illinois, Montana, Alaska, and California.

The leading producers of domestic barite for use in well drilling were (in alphabetical order) Baroid Div., NL Industries, Inc., with mines in Arkansas, Missouri, Nevada, and Tennessee; Dresser Minerals Div., Dresser Industries, Inc., with mines in Missouri and Nevada; and Minerals Div., Milchem, Incorporated, with mines in Missouri and Nevada.

Barite for chemical, glass, and filler uses were sold or used by De Soto, Inc.; Dresser Minerals Div., Dresser Industries, Inc.; Industrial Chemical Div., FMC Corporation; IMCO Services; New Riverside Ochre Co.; De Lore Products, Industrial Chemicals Div., NL Industries, Inc.; Paga Mining Co.; Minerals, Pigments, and Metals Div., Pfizer Inc.; and Westemco, Inc.

Imported and/or domestic barite was ground at 42 plants in 11 States. Louisiana and Texas had seven plants each. The concentration of grinding plants in these States is due to the availability of imported barite and the close proximity to major areas of high drilling activity. Other States with grinding plants were Missouri, with six operations; Nevada and Utah, five each; California, four; Arkansas, Georgia, and Tennessee, two each; and Illinois and Montana, one each.

Total[2]	1,106	16,822	1,287	20,678

W Withheld to avoid disclosing individual company confidential data; included with "Other States."

[1] Arkansas, Georgia, Idaho, Illinois, Montana (1975), and Tennessee.

[2] Data may not add to totals shown because of independent rounding.

CONSUMPTION AND USES

Barite used as a weighting agent in oil- and gas-well drilling fluids represented 90% of all crushed and ground barite produced in 1975. This use increased 14% owing to increased drilling activity. Total footage drilled increased from 153.2 million feet in 1974 to 178.5 million feet in 1975. Barite for use in the manufacture of barium chemicals and as a filler or extender both dropped 28%. Both are related to products that suffered declines from the economic conditions prevalent during most of 1975. Other uses increased 21%. These other uses were as filler in rubber and plastics; flux, oxidizer, and decolorizer in glass manufacture; and miscellaneous uses, including ballast for ships, heavy concrete aggregate, and unspecified industrial uses.

The data in table 3 are mainly for ground barite, but they also include the relatively small tonnage of crushed barite, which is used principally in the barium-chemical industry.

Barite is the principal raw material in the production of barium chemicals. The producers of barium chemicals in 1975 were J. T. Baker Chemical Co., Phillipsburg, N.J.; Barium & Chemicals, Inc., Steubenville, Ohio; Chemical Products Corp., Cartersville, Ga.; Industrial Chemical Div., FMC Corporation, Modesto, Calif.; The Great Western Sugar Company, Johnstown, Colo.; Hummel Chemical Co., Inc., South Plainfield, N.J.; Mallinckrodt Inc., St. Louis, Mo.; and Chemical Div., Sherwin-Williams Co., Coffeyville, Kans. Sherwin-Williams also produced lithopone.

Barium carbonate was the largest volume barium chemical produced and sold, with 49% of total production and 65% of total sales. It is used in the manufacture of television picture tubes, for scum control in brick and tile, in barium ferrite manufacture, and for many other purposes. Barium hydroxide is used in ceramic work, as an additive in oils and greases, and in sugar refining.

Table 3.—Crushed and ground barite sold, by use[1]

Use[2]	1973		1974		1975

[1] Only data reported by barium-chemical plants that consume barite are included.

[2] A plant producing more than one product is counted only once.

PRICES

Prices quoted in Engineering and Mining Journal increased for all classes except water-ground barite, 99.5% $BaSO_4$, 325 mesh. Prices listed in trade publications serve as a general guide but do not necessarily reflect actual transactions.

The average value per ton of crude barite was $16.06 in 1975, an increase of $0.85 per ton over the 1974 value. The average value per ton of crushed and ground barite increased 3% to $40.44 in 1975.

Table 5.—Barite price quotations in 1975

Item	Price per short ton
Chemical, filler, glass grades, f.o.b. shipping point, carload lots:	
Handpicked, 95% $BaSO_4$, not over 1% Fe	$40.00–$60.00
Magnetic or flotation, 96% $BaSO_4$, not over 0.5% Fe	45.00– 50.00
Water-ground, 99.5% $BaSO_4$, 325 mesh, 50-lb bags	60.00– 80.00

FOREIGN TRADE

Barite exports decreased in 1975. Japan was the major recipient of these exports. The barite, primarily ground material, was shipped principally from the following customs districts: Los Angeles, Calif., 65%; New Orleans, La., 15%; Detroit, Mich., 6%; Seattle, Wash., 6%; and Houston, Tex., 3%.

There was 634,000 tons of crude barite and 38,000 tons of ground barite imported in 1975. This represented a 13% decline in imports of crude material and an increase of almost 6% for ground barite. The principal sources were Peru, Ireland, and Mexico. Declared values per short ton of crude barite at foreign ports averaged as follows for these countries: Peru, $11.58; Ireland, $11.19; and Mexico, $12.60.

Crude barite, nearly all of drilling-mud grade, entered the United States through the following customs districts: New Orleans, 48%; Laredo, 20%; Galveston, 15%; Port Arthur, 12%; and Houston, El Paso, and San Francisco combined, 5%.

Import data also showed imports of crude witherite from the United Kingdom, and crushed or ground witherite from Japan and the Netherlands. However, these statistics are open to question because there has been no reported production of witherite since the Settlingstone mine in northern England was closed in 1969. These imports could be manufactured barium carbonate instead of natural barium carbonate (witherite).

Imports of barium chemicals were down 75% compared with those of 1974. All categories except barium nitrate showed significant decreases in quantity. The decline was the result of the general economic downturn in 1975, which caused major production decreases in barium-chemical-consuming industries. Inventory adjustments by domestic consumers also added to the lower import levels.

WORLD REVIEW

World barite production remained at a high level through 1975. Preliminary estimates indicate that the United States supplied 25% of the world total.

France.—A new company, Société Garrot-Chaillac, was formed to work the Rossignal barite deposit 31 miles southeast of Chateauroux. The deposit extends over an area of about 50 acres and averages about 40 to 43 feet in thickness. Reserves are estimated to be about 8.8 million tons. A plant was set up to produce 100,000 tons per year by flotation and an additional 20,000 tons per year by heavy media separation. Operations were due to start in late 1975.[3]

India.—The Government of India announced that effective January 14, 1976, all exports of barite will be channeled through the Government-owned Minerals and Metals Trading Corp. (MMTC). This step is designed to control exports and to obtain a higher unit value for this mineral. Exports of barite for the first 4 months of 1975 totaled 60,600 tons.

The Government has reportedly located a large deposit of barite with reserves of 15 million tons. The deposit is in Margarupeta in the State of Andhra Pradesh.

Other Countries.—Construction or modifications to jig and grinding plants were reported in Algeria, Australia, Indonesia, Iran, Ireland, and Thailand.

Bauxite and Alumina

By Horace F. Kurtz [1]

The bauxite and alumina industries in 1975 were characterized by cutbacks in production rates, particularly in the Western Hemisphere, and postponements or cancellations of plans for expansion. The downturn, following 2 years of strong growth, reflected a general recession in Western countries and a much lower demand for aluminum, the principal end use of bauxite and alumina.

World bauxite production declined 4% to 74 million long tons in 1975. Production of alumina, the intermediate step between bauxite and aluminum production, fell 7% to 29 million short tons.

In the United States, bauxite and alumina production declined 9% and 25%, respectively. Imports of bauxite dropped sharply but still provided 86% of the bauxite used by domestic alumina producers. Imports provided 38% of the new supply of alumina.

Historical data, 1938–75, on bauxite production, imports, and consumption in the United States and world production are presented in table 2.

Legislation and Government Programs.—Jamaica-type metallurgical-grade bauxite in government stockpiles was authorized for sale during 1975, but none was sold. Surinam-type metallurgical-grade bauxite sold previously was shipped from government stockpiles.

Table 1.—Salient bauxite statistics

r Revised.

[1] Excludes calcined bauxite imported into the Virgin Islands.

Bauxite production in the United States decreased 9% to 1.77 million long tons (dry equivalent) in 1975. Production was down 11% in Arkansas, which produced 87% of the total. The loss in Arkansas was partially offset by greater output of bauxite for uses other than alumina in Alabama. All of the bauxite mines were open pit operations except for the Mars Hill underground mine of Reynolds Mining Corp. in Saline County, Ark.

NOTE.—Data for 1910–38 on domestic production, imports, exports, and apparent consumption of bauxite were published in Minerals Yearbook, 1939.

DOMESTIC PRODUCTION

In Arkansas, Aluminum Co. of America (Alcoa), American Cyanamid Co., and Reynolds produced bauxite in Saline County. Reynolds also mined in Pulaski County. Both Alcoa and Reynolds delivered crude bauxite to their own alumina plants nearby. Bauxite processing plants were operated by American Cyanamid, Porocel Corp., and Stauffer Chemical Co.

In Alabama, bauxite was mined in the Eufaula district, Barbour and Henry Counties, by Abbeville Lime Co., A. P. Green Refractories Co., Harbison-Walker Refractories Co., and Wilson-Snead Mining Co. Drying or calcining plants were operated by A. P. Green, Harbison-Walker, and Wilson-Snead.

American Cyanamid and C-E Minerals, Inc., mined bauxite in Sumter County, Ga., and operated processing plants at Andersonville, Ga.

Reduced demand for aluminum resulted in severe cutbacks in operations at both primary aluminum plants and alumina plants in 1975. Production of alumina and aluminum oxide products (excluding aluminates) at the eight alumina plants in the United States and the one plant in the U.S. Virgin Islands decreased 25% to 5,847,000 short tons (5,660,000 tons calcined alumina equivalent) in 1975. The total production included 5,223,000 tons of calcined alumina, 530,000 tons of commercial alumina trihydrate, and 94,000 tons of tabular, activated, and other alumina. The production of all forms of alumina declined.

Alumina shipments by producers totaled 5,860,000 tons (5,671,000 tons calcined equivalent) and were valued at $697 million. Calcined alumina shipments to primary aluminum plants totaled 5,019,000 tons, or 89% of the calcined equivalent of total shipments. The chemical industry, including producers of aluminum fluoride fluxes for aluminum plants, received over half of the remaining tonnage, largely as hydrate. Other shipments of alumina went mainly to producers of abrasives, ceramics, and refractories.

Total	2,225
Grand total	7,805

[1] Capacity may vary depending upon the bauxite used.

CONSUMPTION AND USES

Bauxite consumption in the United States (including the U.S. Virgin Islands) dropped 26%, or about 4.4 million long dry tons, from the record high level of 1974. The large decrease was attributed to the recession in 1975, and consumption was down in all of the major uses of bauxite. About 86% of the bauxite consumed during the year was provided from foreign countries.

The production of alumina in various forms required 92% of the total bauxite consumed in 1975. An average of 2.03 long dry tons of bauxite was used to produce 1 short ton (calcined basis) of alumina. The two alumina plants in Arkansas used mainly bauxite mined in Arkansas, and the other seven alumina plants used only imported ore.

Bauxite use by the refractory industry declined 24% to 410,000 tons (dry weight basis). Nearly all of this bauxite was used in the calcined form, which weighs about 65% of the dry equivalent weight. Imports comprised 77% of the bauxite used in refractories. Refractory producers reported receipts of about 95,000 tons (dry basis) of domestic bauxite and 400,000 tons of imported ore. An estimated 85% of the foreign bauxite came from Guyana, and nearly all of the remainder came from Surinam.

Five companies consumed calcined bauxite in manufacturing artificial abrasives. All of the receipts of bauxite by these companies in 1975 came from Surinam. Total consumption by the abrasives industry dropped 35% from that of 1974. Data on consumption by this industry include bauxite fused and crushed in Canada because much of this material is made into abrasive wheels and coated products in the United States. About 10% to 15% of this material is used for nonabrasive applications, principally refractories.

Bauxite consumption in the chemicals industry decreased 15% in 1975. The United States, Guyana, and Surinam continued to be the sources of bauxite for this industry. The production of commercial aluminum sulfate in the United States, according to the Bureau of the Census,[2] decreased from 1.28 million short tons in 1974 to 1.06 million tons in 1975.

Other consumers of bauxite, in descending order of magnitude, included the cement, oil and gas, and steel and ferroalloys industries, and municipal waterworks.

Thirty-one primary aluminum plants in the United States consumed 7,508,000 short tons of calcined alumina, 20% less than the 9,384,000 tons consumed in 1974. Alumina consumption data for other uses were not available. A significant quantity was used to make aluminum fluoride and synthetic cryolite, which are also used in the production of primary aluminum.

STOCKS

Total inventories of bauxite in the United States rose by 6% to 20.8 million long dry tons during 1975. The overall increase was largely the result of a buildup of stocks at alumina plants. Refractory producers also increased stocks, but abrasive producers reduced inventories significantly. Government stockpiles were lowered by 86,000 tons, all of which was Surinam-type bauxite.

The Government stockpile at the end of 1975 included 4,638,000 tons of Jamaica-type bauxite, which was the total stockpile objective, 9,789,000 tons of Jamaica-type, Surinam-type, and refractory-grade bauxite classified as uncommitted excess (unsold), and 639,000 tons committed for disposal.

Inventories of alumina and related products at plants producing alumina and primary aluminum increased 103,000 short tons to 1,458,000 tons. The Government held no stocks of alumina except in the form of abrasive grain and crude fused aluminum oxide. These stockpiles were reduced 5% to 338,000 short tons.

Table 11.—Stocks of bauxite in the United States [1]

Primary aluminum plants	1,125	1,241
Total	1,355	1,458

[1] Excludes consumers' stocks other than those at primary aluminum plants.

PRICES

Prices on most of the bauxite and alumina produced throughout the world are not quoted because the large tonnages used by the aluminum industry are usually obtained from affiliated companies or purchased under long-term negotiated contracts.

Bureau of Mines estimates of the value of domestic production were based on incomplete data supplied by producers. The Bureau's estimated average value of crude domestic bauxite shipments in 1975, f.o.b. mine or plant, was $11.50 per long ton. The average value of shipments of domestic calcined bauxite was estimated at $43.80 per ton. Bauxite values among producers varied widely because of differences in grade.

The average value of imported dried or partially dried bauxite consumed at alumina plants in the United States and the Virgin Islands in 1975 was estimated from reports to the Bureau of Mines at $29.85 per long dry ton, compared with $23.21 in 1974. Engineering and Mining Journal published the following prices on supercalcined refractory-grade bauxite imported from Guyana, car lots, per metric ton:

	January-March	April-October	November-December
F.o.b. Baltimore, Md	$104.15	$105.61	$105.81
F.o.b Mobile, Ala	104.28	105.87	105.57

The average value of domestic calcined alumina shipments as determined from producers' reports was $116.35 per short ton. Shipments of alumina trihydrate averaged $101.38 per ton. The average value of imported alumina (including small quantities of hydrate), as reported by the Bureau of the Census, was $105.50 per ton at port of shipment. Exports of alumina from the United States and the Virgin Islands averaged $130.23 per ton.

Table 13.—Market quotations on alumina and aluminum compounds

(In bags, carlots, freight equalized)

Compound		Jan. 3,1975	Jan. 2, 1976
Alumina, calcined	per pound	$0.068–$0.069	$0.08
Alumina, hydrated, heavy	do	.0558	.06
Alumina, activated, granular, works	do	.1365	.1365
Alumina sulfate, commercial, ground (17% Al_2O_3)	per ton	99.00	111.00
Aluminum sulfate, iron-free dry (17% Al_2O_3)	do	115.60	140.00

FOREIGN TRADE

Exports from the United States classified as "bauxite and concentrates of aluminum excluding alumina" totaled 19,000 long tons in 1975 and were valued at $1.65 million. Virtually all of these exports went to either Canada or Mexico.

Alumina exports increased 4% to 766,000 short tons, including 24,000 tons of aluminum hydroxide. Most of the exports were shipped from domestic alumina plants to affiliated aluminum plants in Canada, Ghana, Mexico, Venezuela, and Norway. An additional 263,000 tons was exported from the alumina plant in the U.S. Virgin Islands to the U.S.S.R., Norway, and Yugoslavia.

Annual aluminum sulfate exports increased to 48,000 short tons, valued at $2.9 million. Venezuela received 36,000 tons, and Canada received 5,000 tons. Exports of artificial corundum or fused aluminum oxide fell to 27,000 tons, valued at $13.6 million. Canada received the largest quantity among 49 recipient countries. Exports classified as "other aluminum compounds" declined to 43,000 tons, valued at $16.3 million. Much of this tonnage was believed to be aluminum fluoride and synthetic cryolite shipped to other countries for use as a flux in making primary aluminum. About 10,000 tons was shipped to Australia, 8,000 tons to Ghana, and 6,000 tons each to Surinam and Bahrain.

No duties were imposed on imports of bauxite, alumina, or aluminum hydroxide in 1975. All duties on these commodities were suspended in 1971.

Imports of crude, partially dried, and dried bauxite decreased 25% to 10.8 million long tons in 1975, reflecting a sharply reduced level of operations at domestic alumina plants. Receipts from all major import sources except Guinea declined. Half of the imports came from Jamaica, the largest source of bauxite for plants on the U.S. mainland since 1957. Surinam and Guinea each provided 17%, and the Dominican Republic and Haiti provided most of the remainder. An additional 939,000 tons of bauxite was imported into the U.S. Virgin Islands from Guinea and Guyana.

Imports of calcined bauxite into the United States increased to a record high level of 348,000 long calcined tons. Most of this tonnage was refractory-grade bauxite from Guyana. Additional calcined bauxite was imported into Canada from Surinam for manufacture into crude fused aluminum oxide, much of which was subsequently used in abrasive and refractory products in the United States.

Alumina imports, including small quantities of aluminum hydroxide, declined 3%. However, the proportion of total new supply of alumina (imports plus domestic production) provided by imports increased to 38%. Shipments from Australia accounted for 61% of the total imports, Jamaica provided 22%, and Surinam provided 14%.

WORLD REVIEW

World bauxite production was estimated at nearly 74 million long tons, a decline of about 4% from 1974. Australia, Jamaica, and Guinea, the three largest producers, accounted for 56% of the 1975 total. The 11-member International Bauxite Association, which includes these three countries and the Dominican Republic, Ghana, Guyana, Haiti, Indonesia, Sierra Leone, Surinam, and Yugoslavia, produced 74% of the total. Production declined in half of the bauxite-producing countries. Jamaica and Surinam showed the largest decreases in production, while Guinea made the most significant increase.

World alumina production declined 7% to 29 million short tons in 1975. Most of the decline occurred in North America, where total output dropped 23%. The United States and Australia each produced 19% of the world total.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, Southern Rhodesia may have continued to produce bauxite during the period covered by this table; however, no information on bauxite mining activities, if any, has been available since 1965.

[2] Dry bauxite equivalent of crude ore.

[3] Shipments.

[4] Dry bauxite equivalent of ore processed by drying plant.

[5] Bauxite processed for conversion to alumina in Jamaica plus exports of kiln-dried ore.

[6] Excludes materials other than bauxite used for production of alumina, estimated as follows in thousand long tons: Nepheline syenite (25% to 30% alumina), 1973—[r] 1,180, 1974—[r] 1,280, 1975—1,280; alunite ore (16% to 18% alumina): 1973—[r] 390, 1974—[r] 390, 1975—390.

[7] Diasporic bauxite; includes an estimated 160,000 long tons annually of production for refractory applications.

[8] Less than ½ unit.

e Estimate. p Preliminary. r Revised.

[1] In addition to the countries listed, Austria produces alumina (fused aluminum oxide), but output is used entirely for abrasives production. Production was as follows in short tons: 1973—31,110, 1974—not available, 1975—not available.

[2] The U.S.S.R. imports from Turkey; actual output may have been somewhat larger to provide raw material for an aluminum smelter due to begin operation in 1975.

[e] Estimate.

Australia.—Alcoa of Australia (W.A.) N.L. operated its two alumina plants in Western Australia below rated capacity throughout most of 1975 because of decreased demand. Expansion of the Pinjarra refinery to an annual capacity of 2.2 million short tons was virtually completed. The new Huntley mine, about 3 miles north of the Del Park mine site, was opened and will provide additional bauxite for Pinjarra. A plant to produce 55,000 tons per year of hydrated alumina began production at the Kwinana refinery.

Comalco Ltd.'s bauxite production at Wiepa, Queensland, increased slightly to about 9.4 million long tons. Shipments of beneficiated bauxite declined 2% to 9.0 million tons, of which 52% went to the Gladstone alumina plant in Queensland, 14% to Japan, and 34% to Europe.

Nabalco Pty. Ltd. increased its bauxite production at Gove, Northern Territory, by 500,000 tons to 4.4 million tons in 1975. Production of alumina at the Gove refinery increased 14% to 1,028,000 short tons.

A bauxite-alumina project on the western side of the Cape York Peninsula was under consideration by Aurukun Associates, which consisted of a Texas-based company, Tipperary Corp. (40%), Billiton Aluminum Australia (40%), and Aluminium Pechiney Holdings Pty. (20%). Although the Queensland Parliament passed legislation permitting the consortium to proceed, objections were being raised by aborigines on whose reservation the bauxite occurs.

Brazil.—Mineração Rio do Norte S.A., an international consortium, announced plans to begin construction early in 1976 of the Trombetas bauxite mining project in the Amazon Basin. Construction costs were estimated at $280 million. Initial production at the rate of 3.3 million long tons per year was scheduled for early 1979, with plans for possible expansion to over 8 million tons per year. The consortium consisted of Cia. Vale do Rio Doce (CVRD) 40%, Alcan Aluminum Ltd. 19%, Cia. Brasileira de Alumínio (CBA) 11%, Reynolds Metals Co. 5%, Norsk Hydro A/S 5%, Ardal og Sunndal Verk (ASV) 5%, Instituto Nacional de Industria 5%, Rio Tinto Zinc Corp., Ltd. 5%, and two affiliates of the Royal Dutch Shell Group 5%. It was announced that Rio do Norte planned to set a reference price for bauxite every 4 years in order to guarantee a 13% return on investment for its shareholders.

Alumínio do Brasil (Albras) continued feasibility studies for an alumina-aluminum complex near Belém in Pará. The annual capacity of the alumina refinery was indefinite at yearend and may be reduced from the original announcement of 1.4 million short tons to about 700,000 tons. Power for the project would be supplied by a hydroelectric plant on the Tocantins River. Ownership of Albras consisted of CVRD and the Light Metals Smelters Association, a group of five Japanese aluminum companies. Alcan was reportedly interested in participating in the alumina sector of the project.

British Solomon Islands.—Mitsui Mining and Smelting Co. and Pacific Aluminum Pty. Ltd., a subsidiary of Conzinc Riotinto of Australia Ltd. (CRA), undertook a feasibility study for an alumina refinery on Rennell Island. Bauxite for the project would be supplied from the estimated 30-million-ton deposit on Rennell Island and a 28-million-ton deposit on Wagina Island. Ownership of the facility, which would have a first-stage production of 660,000 short tons per year, would include Mitsui, CRA, and the Government of the British Solomons.

Costa Rica.—Alcoa decided not to proceed with the development of bauxite mining and the construction of an alumina plant in Costa Rica. The Government and Alcoa agreed to terminate the contract, effective May 1976.

Dominican Republic.—The Government and Alcoa reached agreement on new bauxite levies, retroactive to April 1, 1974. The levies were set at 7.5% of the price realized on primary aluminum for 1974 and 7.7% for 1975 and 1976. In addition to the levy, a royalty of 56 cents per long ton will be assessed.

Germany, Federal Republic of.—Swiss Aluminium Ltd. (Alusuisse) was reported to have abandoned plans for a 330,000-short-ton-per-year bauxite refinery at Wilhelmshaven.

Ghana.—Bauxite Alumina Study Co. Ltd. (Bascol), composed of Kaiser Aluminum & Chemical Corp. and Aluminum Resources Development Co. (Ardeco), representing five Japanese aluminum companies, continued studies on the feasibility of a bauxite mining operation in the Kibi area and a large new alumina plant based on bauxite from Kibi. Ardeco reportedly withdrew from the project near yearend.

Greece.—Bauxite exports increased 9% to 1.6 million long tons in 1975. Export quotas set by the Government for 1976 totaled 3,132,000 tons compared with 3,105,000 tons set for 1975.

Bauxite Parnasse, S.A., continued a feasibility study for a 660,000-short-ton-per-year alumina refinery on the Gulf of Corinth. The proposed alumina production would be for export, and plant capacity eventually could be doubled. Aluterv of Hungary was to provide the technology for the plant. As envisioned at yearend, equity would be shared by Bauxite Parnasse 30%, Hellenic Industrial Development Bank 21%, and foreign participants 49%. Two U.S. companies, National Steel Corp. and Southwire Co., were expected to be the foreign participants. Financing for the $200 to $250 million plant reportedly would be arranged by Chase Manhattan Bank.

Guinea.—Guinea produced an estimated 9 million long tons of bauxite in 1975 and became the third largest bauxite producing country. Guinea Bauxite Co. (CBG), operators of the Boké project, produced over 5 million tons, and Friguia and Kindia Bauxite Office (OBK) each produced nearly 2 million tons.

CBG, owned by Halco (51%) and the Government of Guinea (49%), shipped high-grade bauxite from its plant and port at Kamsar largely to members of Halco. Halco was a consortium of aluminum producers consisting of Alcoa (27%), Alcan (27%), Martin Marietta Aluminum, Inc. (20%), Pechiney Ugine Kuhlmann Group (PUK) (10%), Vereinigte Aluminium-Werke AG (VAW) (10%), and Alumetal S.p.A. (6%).

Friguia, owned by Frialco Co. (51%) and the Government of Guinea (49%), mined bauxite for its alumina plant in Guinea. Frialco was another consortium consisting of Noranda Mines, Ltd. (38.5%), PUK (36.5%), The British Aluminium Co. Ltd. (10%), Alusuisse (10%), and VAW (5%). OBK mined bauxite at Débélé in the Kindia region entirely for export to the U.S.S.R.

The Government and Alusuisse joint venture, Société Minière et de Participations Guinée-Alusuisse (Somiga), continued to plan for mining the bauxite deposits at Tougué, estimated at 2 billion tons. Reported plans included construction of facilities to produce 8 million tons per year of bauxite and 1.2 million tons per year of alumina. The alumina plant would be constructed with Yugoslav assistance.

The Governments of Guinea, Egypt, Kuwait, Libya, Saudi Arabia, and the United Arab Emirates signed an agreement to form an aluminum company which would exploit bauxite deposits in the Ayékoyé area north of the CBG Boké concession. Reserves were estimated at 500 million tons with an alumina content of 51.6% to 59.6%. Reported plans for the new venture included a 9-million-ton-per-year bauxite mining operation and a 2-million-ton-per-year alumina refinery.

In January 1975, the Government adopted new tax legislation covering mineral ores exported from Guinea. The taxes on bauxite and alumina were indexed to the market price of aluminum ingot. The tax per ton of bauxite ranged from 0.5% of the price per ton of aluminum for the lowest grade ores to 0.75% for bauxite containing over 55% Al_2O_3. The rate per ton of alumina was 1.0% of the price per ton of aluminum.

Guyana.—Reynolds Guyana Mines Ltd. was nationalized January 1, 1975, and was operated during the year as Berbice Mines (Bermine). The operating rate was cut sharply because of the loss of Reynolds as a market for its metallurgical-grade bauxite. Marketing for Bermine bauxite was conducted by the Government-owned company, Guyana Bauxite Co. (Guybau), the only other bauxite producer in Guyana. The bauxite mining operations of Bermine and Guybau were described.[3]

Guybau production of metal-grade bauxite and calcined bauxite increased to 814,000 and 691,000 long tons, respectively, while its production of calcined alumina declined slightly to 329,000 short tons. A new kiln under construction was expected to add 150,000 tons per year of bauxite calcining capacity in 1976. As protection against fluctuating foreign exchange rates in its worldwide sales of calcined bauxite, Guybau announced a plan to set payment prices using a composite currency unit based on the U.S. dollar, the pound sterling, the German deutsche mark, and the Swiss franc.

---

———. Guybau Develops New Bauxite Mine, Increases Calcined Bauxite Capacity. V. 28, No. 11, October 1975, pp. 38–41.

Haiti.—Reynolds Haitian Mines, Inc., and the Haitian Government reached a new agreement on bauxite taxes to be paid by Reynolds. The agreement included a bauxite production tax based on a rate of 7.5% of the price of primary aluminum for 1974 and 8.0% for 1975 and 1976, and an additional tax of 50 cents per long dry ton on bauxite exported. Reynolds also agreed to export at least 600,000 long dry tons per year.

Hungary.—The Rakhegy II bauxite mine in the Fejer district reached capacity production of 480,000 tons per year by yearend. Bauxite reserves reportedly were sufficient for production at this rate until 1986. Another new mine, the Deaki Puszta mine, with reserves estimated at 6.5 million tons, was scheduled to begin production in 1977.

India.—Discoveries of bauxite in India in the 1970's, particularly in the east coast States of Orissa and Andhra Pradesh, have greatly increased estimates of total Indian reserves and altered plans for establishment of new alumina plants. Evaluation of the reserves by State and Federal Government agencies continued through 1975. One estimate, prepared by the Government company, Metallurgical and Engineering Consultants, Ltd., classified reserves, in millions of long tons, as follows:

State	Measured or indicated	Inferred	Total
Orissa	126	473	599
Andhra Pradesh	50	356	406
Maharashtra	102	17	119
Madhya Pradesh	71	28	99
Bihar	24	21	45
Gujarat	21	22	43
Other	44	11	55
Total	438	928	1,366

Large additional discoveries of bauxite averaging 40% to 45% Al_2O_3 have been reported in Madhya Pradesh. The principal bauxite-producing States in 1975 were Bihar (454,000 tons), Madhya Pradesh (351,000 tons), and Maharashtra (237,000 tons).

As a result of the bauxite discoveries in Orissa and Andhra Pradesh, a new Government-owned alumina-aluminum complex was being considered for the Vishakapatnam area. The U.S.S.R. was reported to have abandoned plans for a 550,000-ton-per-year export-oriented alumina plant based on bauxite from Madhya Pradesh and to be considering a plant on the east coast. Reportedly, Iran was also considering an export-oriented plant on the east coast, as well as providing assistance for an alumina plant in Gujarat on the west coast.

Indonesia.—Indonesia became the 11th member of the International Bauxite Association in November 1975.

Ireland.—The owners of Alcan Ireland Ltd. postponed construction of a proposed alumina plant to produce 880,000 short tons per year on Aughinish Island. Alcan Ireland Ltd. was composed of Alcan (70%), Årdal og Sunndal Verk (20%), and Granges Essem AB (10%). The partners planned to review the proposal again in 1977.

Jamaica.—Bauxite and alumina was produced by affiliates of six North American aluminum companies. In addition to the bauxite produced to supply the five alumina plants on the island, Jamaican bauxite was exported, largely to plants in the United States, by Kaiser Bauxite Co., Reynolds Jamaica Mines Ltd., and Alcoa Minerals of Jamaica, Inc.

Decreased world demand forced the producers of bauxite and alumina to cut back production during 1975. Alumina Partners of Jamaica (Alpart) and Alcoa reduced the level of alumina production in February and June, respectively. In August, Revere Jamaica Alumina, Ltd., announced the closing of its alumina plant at Maggotty because of reduced aluminum production. Revere also announced in September that a decision to expand the Maggotty plant along with its aluminum smelter at Scottsboro, Ala., had been postponed by Revere and its proposed Japanese partners.

Operations were further curtailed by strikes and work slowdowns which affected all of the producers. Strikes at bauxite mines, beginning in late September and ending in November, disrupted the operations of Kaiser, Reynolds, and Alcan. Labor disputes at the Schwallenberg mines of Alcan resulted in the temporary closing of its alumina plant at Ewarton.

The Government and Reynolds reached agreement in principle on the terms of a partnership, similar to one announced in

1974 between the Government and Kaiser. Under the arrangement, Reynolds would sell to the Government a 51% interest in its mining assets and all of Reynolds' land holdings in Jamaica (approximately 66,000 acres) at book value, to be paid over 9 years. Reynolds would continue to manage the mining operations under a 7-year contract. Jamaica would lease bauxite land to the mining company sufficient to cover Reynolds' exports over a 40-year period. The agreement also was reported to include reductions in the rate of Reynolds' bauxite production levy provided Reynolds participated in a proposed alumina project of the Governments of Jamaica and Mexico.

Japan.—Nippon Light Metal Co. Ltd. announced plans to double its capacity for producing nonmetallurgical alumina at Shimizu to 220,000 tons per year.

Pakistan.—Construction of an alumina plant based on bauxite from Pakistan was being considered as a source of alumina for the smelter at Arak, Iran, in which Pakistan holds a 5% interest. A 1-ton-per-day alumina pilot plant was under construction at Khushab.

Philippines.—West Pacific Alumina Corp., an international consortium of eight metal producers, delayed a decision on the construction of a 770,000-ton-per-year alumina refinery on Mindanao. Bauxite for the project would be supplied on a long-term basis by Comalco from its Weipa deposits in Australia.

Surinam.—Bauxite was mined by Surinam Aluminum Co. (Suralco), an Alcoa subsidiary, and N.V. Billiton Maatschappij Suriname. Suralco also produced alumina and aluminum and converted bauxite to alumina for Billiton. Total exports of bauxite, most of which was shipped to the United States, decreased 41% to 2.29 million long tons in 1975. Exports of alumina increased 1% to 1.2 million short tons, of which 58% was shipped to Europe and 39% was shipped to the United States. Construction of a new bauxite calcining plant at Smalkalden by Billiton and Alcan was indefinitely postponed.

Taiwan.—A doubling of the capacity of Taiwan Aluminium Corp's alumina plant at Kaohsiung was expected to be completed by the end of 1976.

Yugoslavia.—Energoinvest began production in August at its new alumina plant at Bacevici near Mostar. Annual capacity of the plant was rated at 309,000 short tons. Another Energoinvest plant at Zvornik, also in Bosnia-Hercegovina, was due onstream in 1977 with a capacity of 660,000 tons per year. A third new alumina plant, with an annual capacity of 330,000 tons, was under construction for Jadral at Obrovac, Dalmatia. This plant was expected to be completed in 1976 and will use bauxite from Jadral's Jesenica, Krusevo, and Drnis mines.

The bauxite mines at Niksic, which supplied the Titograd alumina refinery, were under expansion to increase output from about 500,000 tons per year to 1 million tons by 1980 and to 1.5 million tons by 1985.

TECHNOLOGY

Increased costs of imported bauxite since 1974 and uncertainty about future supplies of bauxite from foreign countries have stimulated research and development on processes to use nonbauxitic aluminum resources in countries with insufficient bauxite resources. Pechiney and Alcan expected to complete construction of the pilot plant near Marseilles, France, in 1976. The plant will test the H-Plus process,[4] which uses both sulfuric acid and hydrochloric acid to recover high-purity alumina from shale, clay, and other low-grade aluminous materials. The plant was designed to produce 20 tons of alumina per day.

Construction was reported to have begun on a commercial-size plant in the Province of Kielce, Poland, to produce alumina from low-grade aluminiferous materials using the Grzymek process.[5] The plant was expected to produce 110,000 tons of alumina per year and several times that quantity of cement byproduct.

The joint venture of Earth Sciences, Inc., National Steel Corp., and Southwire Co. continued its research and planning for the production of alumina and fertilizer byproducts using alunite deposits in southwestern Utah. Under an agreement announced in April, funding for the group's proposed \$360 million production complex would be the responsibility of National Steel and Southwire, each of which holds a 40% interest in the venture. Earth Sciences holds a 20% interest in the complex on a carried interest basis and a 50% interest in alunite properties the group has acquired outside Utah.

[5] Grzymek, J. Prof. Grzymek's Self-Disintegration Method for the Complex Manufacture of Aluminum Oxide and Portland Cement. Light Metals, v. 2, 1976. pp. 29–39, (Proceedings of Sessions, 105th AIME Annual Meeting).

The Bureau of Mines continued its research on the recovery of alumina from domestic nonbauxitic aluminum resources.[6] The most promising technologies for extracting alumina from clay and other raw materials were being tested and developed in miniplants at the Bureau's Boulder City, Nev., laboratory. The miniplant program was initiated to evaluate the various processes on a comparative basis and to obtain cost and engineering data for the design and operation of large-scale demonstration plants. Ten companies were participating in the project with the Bureau on a cooperative, cost-sharing basis.

During 1975, a miniplant to treat kaolinitic clay using a nitric acid process was operated, and alternative methods for decomposition of the aluminum nitrate monohydrate produced in the process were investigated. A miniplant to process clay using a hydrochloric acid process was under construction, and test runs were made of the leaching and solvent extraction sections. Research on methods of processing anorthosite was conducted to obtain data for the design of a third miniplant.

Beryllium

By Benjamin Petkof[1]

Consumption of beryllium ore declined to almost half that of 1974. After five consecutive years of decline, imports of ore increased. Exports of beryllium products declined sharply. Domestic production of bertrandite continued to provide a substantial part of world beryllium minerals.

Table 1.—Salient beryllium mineral statistics

	1971	1972	1973	1974	1975
United States:					
Beryl, approximately 11% BeO:					
Shipped from mines ---------- short tons --	W	W	W	--	W
Imports ---------------------------- do ----	4,026	3,345	1,586	1,368	1,479
Consumption[1] ---------------------- do ----	10,373	7,781	8,695	9,279	4,850
Price, approximate, per unit BeO, imported cobbed beryl at port of exportation -----	$33	$30	$30	$30	$30
Bertrandite ore: Utah, low-grade, shipped from mines -------------------------- short tons --	W	W	W	W	W
World production of beryl ---------------- do ----	5,791	4,330	3,963	[r] 3,472	3,558

[r] Revised. W Withheld to avoid disclosing individual company confidential data.

[1] Includes bertrandite ore which was calculated as equivalent to beryl containing 11% BeO.

Legislation and Government Programs.—In January 1975 legislation was introduced in the Congress to authorize disposal of excess beryl from the strategic stockpile. However, the Congress took no action during the year.

The Occupational Safety and Health Administration (OSHA) of the U.S. Department of Labor published a proposed occupational safety and health standard for beryllium in the Federal Register, October 17, 1975. The proposed standard stressed measures against the potential carcinogenic effects of beryllium.

DOMESTIC PRODUCTION

Bertrandite ore accounted for most of the domestic commercial beryllium mineral production during the year. Brush Wellman Inc. (Brush) produced the bertrandite at its Spor Mountain mine in Millard County, Utah. A small quantity of beryl production was reported at Keystone, S. Dak.

Brush converted its ore to beryllium hydroxide at its facility at Delta, Utah, and then shipped the hydroxide to its Elmore, Ohio, facility for conversion to beryllium oxide, metal, and copper alloy.

Kawecki-Berylco Industries, Inc. (KBI) produced beryllium materials, principally from imported beryl. The company processed beryllium materials at its plants in Hazelton and Reading, Pa., into beryllium metal, copper alloy, aluminum alloy, and oxides.

Production in nearly all phases of the beryllium industry was down in 1975, largely owing to the general phasing out of the Department of Defense beryllium-consuming missile programs such as the Poseidon and the Minuteman.

---

[1] Physical scientist, Division of Nonferrous Metals.

CONSUMPTION AND USES

The domestic beryllium industry consumed beryllium ore equivalent to 4,850 tons of beryl containing a nominal 11% Be0, a decline of almost 50% from that of 1974. This decline reflected the Nation's general economic condition during the year, as well as decreased military and civilian requirements for beryllium metal, alloy, and oxide.

Beryllium metal consumption continued where a high stiffness-to-weight ratio was required in applications such as optics, X-ray transmission windows, aircraft brakes and structures, missile parts, and nuclear installations.

Products utilizing beryllium-copper alloys accounted for the greatest quantity of beryllium consumption. These alloys were used by the business machine, appliance, transportation, and communications industries. Beryllium-copper alloys were also widely used in electrical and electronic systems for connectors, sockets, switches, and temperature- and pressure-sensing devices to provide reliability and long service life.

Beryllium oxide ceramics found use in devices such as lasers, microwave tubes, and semiconductors. Power amplifiers for microwave and radio communications, electronic ignition systems, and power regulators were typical applications.

STOCKS

Consumer stocks of beryllium minerals totaled 3,546 tons at yearend 1975, a 20% decline from those of 1974. Dealers' stocks of beryl were not reported.

PRICES AND SPECIFICATIONS

With only very limited production of domestic beryl during the year, there were no known price quotations for domestically produced beryl. The price of any available domestic beryl was negotiated between buyer and seller. Metals Week quoted the price of imported beryl at $30 per short ton unit of contained BeO throughout the year.

At yearend the American Metal Market quoted the following prices for beryllium materials: Vacuum-cast metal ingot, $75 per pound; metal beads (97% purity), $61 per pound; metal powder, $56 to $63 per pound; metal rod, $125.55 per pound; beryllium-copper master alloy, $59 per pound of contained beryllium; beryllium-copper casting alloy, $2.02 to $2.79 per pound; beryllium copper in strip, rod, bar, and wire, $3.96 per pound; beryllium-aluminum alloy ingot, $72 per pound; and beryllium oxide powder, $26 per pound.

FOREIGN TRADE

Exports of wrought and unwrought beryllium alloys and of waste and scrap declined 74% in quantity but increased 4% in value over those of 1974. This was caused by high-value shipments during the year. The average value of exports increased almost fourfold, from $7.71 per pound in 1974 to $30.85 per pound in 1975, indicating greater overseas demand for higher valued finished beryllium forms. In terms of quantity, 94% of the total material exported went to the United Kingdom (31%), Canada (26%), Japan (15%), France (12%), Mexico (7%), and Switzerland (3%).

Beryl imports increased 8% in quantity and 13% in value over those of 1974. This was the first increase since 1969. The average value of imported material was $316 per ton, a 4% increase from that of 1974. Eighty percent of U.S. imports originated in Brazil (55%), the Republic of South Africa (17%), and Uganda (8%). In addition, 24,888 pounds of wrought, unwrought, and waste and scrap beryllium metal valued at $179,087 were imported.

WORLD REVIEW

Total world production of beryllium minerals increased slightly during 1975. The bertrandite mining operation in the United States was believed to be the only mine operated solely for beryllium minerals. All other beryllium mineral production was in conjunction with production of other pegmatite minerals.

In the future, world production of hand-sorted beryl is likely to decline because of increasing labor costs and may be replaced by other beryllium minerals that can be mined and produced by continuous mining and processing methods.

[1] In addition to the countries listed, the Territory of South West Africa may also have produced beryl, but available information is inadequate to formulate reliable estimates of output levels.

TECHNOLOGY

A bibliography describing research conducted during the period 1964–75 on pollution of air and water by beryllium was published.[2] The report included information on sources, control, detection and analysis, and toxic effects on plants, animals, and humans.

An alloy containing 62% beryllium and 38% aluminum by weight was used for a primary structure in a high-speed aircraft. The alloy has the required stiffness at room temperature and at 600° F. Its use greatly increased the torsional and chordwise stiffness of the aircraft. As a result, this alloy is under consideration for structural and thermal protection applications in hypersonic research aircraft currently under development by the National Aeronautics and Space Administration and the U.S. Air Force.[3]

Bismuth

By John A. Rathjen [1]

United States bismuth consumption, production, and imports recorded significant declines in 1975, continuing trends which began in mid-1973. Consumption of refined bismuth dropped 878,000 pounds to 1.4 million pounds, the lowest annual usage since 1958. All of the major use categories decreased and cumulatively were about 38% less than in 1974. Exports of bismuth during 1975 were also reduced by approximately 61%, reflecting a lack of demand in world markets. Despite the general downtrend, the domestic producer price remained firm throughout the year averaging $7.72 per pound. World bismuth mine production declined 26%. The largest cutbacks, other than in the United States, were in Australia, Mexico, Japan, Canada and Yugoslavia which together produced 2.9 million pounds less than that in 1974.

[r] Revised.
[1] Includes bismuth, bismuth alloys, and waste and scrap.
[2] Excludes the United States.

Legislation and Government Programs.—Government stocks of bismuth remained at 2,100,004 pounds. Broken down, the total represents 585,892 pounds in the national stockpile, and 1,514,112 pounds in the supplemental stockpile. The stockpile objective is 95,900 pounds, indicating a surplus of 2,004,104 pounds which requires Congressional action for public disposal.

Bismuth remained on the list of commodities eligible for exploration assistance under the program administered by the Office of Minerals Exploration. Government participation remained at 75% of the exploration costs, but no contracts were in force during the year.

Federal income tax laws under the Tax Reform Act of 1969 provided a percentage depletion allowance of 22% for domestic production and 14% for U.S. companies producing from foreign sources.

---

[1] Mineral specialist, Division of Nonferrous Metals.

DOMESTIC PRODUCTION

Bismuth is produced essentially as a byproduct in the treatment of lead ores and bullion from foreign and domestic sources.

ASARCO Inc. continued as the only domestic producer of primary bismuth at its Omaha, Nebr. plant. Production in 1975 was reduced from the level of 1974 owing to depressed market conditions. A small quantity of bismuth was recovered from recycling of secondary material by the United Refining and Smelting Co. at Franklin Park, Ill. Refinery production statistics in the United States are withheld to avoid disclosing company confidential data.

An anticipated increase in domestic production from The Anaconda Company's Victoria mine in Elko County, Nev., did not materialize owing to a temporary shutdown of the Arbiter plant at Anaconda, Mont. Production is expected to resume in July 1976 with bismuth as a byproduct in the hydrometallurgical refining of complex copper ores.

CONSUMPTION AND USES

Consumption of bismuth in the United States during 1975 was 1.4 million pounds, a sharp drop from the 2.3 million pounds used in 1974. All major categories of use were affected, with the largest decrease occurring in fusible alloys which declined by 46% from that of 1974. Consumption as a metallurgical additive was also curtailed to about 62% of the 1974 level. Reductions in both these categories reflect a general sluggishness in the domestic economy which prevailed through 1975. Bismuth used in fusible alloys for the manufacture of fire control devices, forming dies, and holding fixtures, paralleled a decline in the construction and machine tool industries. Bismuth consumed as a metallurgical additive in the manufacture of certain cast iron, steel, and aluminum specialty metals also declined when foundries and mills reduced production schedules to meet lesser demand.

Bismuth used in pharmaceuticals, which include therapeutic, cosmetic, and industrial applications, also dropped sharply to 553,000 pounds, approximately 66% of the 1974 figure. The loss was primarily in industrial chemicals where bismuth is used as a catalyst in the manufacture of acrylonitrile. Use in cosmetics is also beginning to decrease as the "pearlescent look" gives way to changing fashion.

Table 2.—Bismuth metal consumed in the United States, by use

Experimental uses	805	718
Other uses	6,586	7,856
Total	2,283,978	1,406,021

[1] Includes industrial and laboratory chemicals and cosmetics.

STOCKS

Consumer stocks declined about 24% in the course of the year, ending at 451,000 pounds. Data on producer and dealer stocks are not available, however, it is generally believed that adequate supplies were being held pending an upward turn in demand.

PRICES

The domestic producer price for refined bismuth was lowered from $9 to $7.50 per pound during the first quarter of 1975, where it remained for the balance of the year. Dealer prices were quoted from $6.20 to $6.60 per pound early in the year, dropping to $5.55 to $5.60 at yearend. Reports that metal was available at a discount during November and December were attributed to cash liquidation of dealer stocks.

FOREIGN TRADE

Exports of bismuth in all forms dropped sharply in 1975 to a level of 129,000 pounds compared with 330,000 pounds during 1974. During 1975, bismuth was exported to 15 countries of which 6 accounted for 94% of total shipments. The principal countries receiving U.S. exports in order of declining volume were: Canada, 48,000 pounds, 37%; Belgium-Luxembourg, 38,000 pounds, 30%; the Netherlands, 13,000 pounds, 10%; West Germany, 10,000 pounds 8%; the United Kingdom, 7,000 pounds, 6%; and Spain, 4,000 pounds, 3%.

General imports of metallic bismuth during 1975 declined by 563,000 pounds to 1.3 million pounds. This reduction was attributed primarily to reduced demand in the domestic market. Six countries supplied about 87% of the U.S. import total during 1975. The United Kingdom was the largest shipper with 434,000 pounds, 33%; followed by Japan, 191,000 pounds, 14%; Mexico, 162,000 pounds, 12%; Peru, 141,000 pounds, 11%; the Republic of Korea, 126,000 pounds, 9%; and West Germany, 102,000 pounds, 8%.

WORLD REVIEW

The worldwide tone of the bismuth industry in 1975 was generally depressed with levels of production, consumption, and international commerce lower than those in 1974. World production was curtailed as a result of depressed market conditions for bismuth as well as its primary host metals, copper and lead. Industry stock figures are not available on a global basis, however, it was felt in the trade that yearend inventories were larger than needed for normal working conditions.

[1] In addition to the countries listed Brazil, Bulgaria, East Germany and the Territory of South-West Africa are believed to produce bismuth, but available information is inadequate for formulation of reliable estimates of output levels.

[2] Production by COMIBOL, plus exports and local sales by medium and small mines.

[3] Bismuth content of refined metal, bullion and alloys produced indigenously, plus recoverable content of ores and concentrates exported for processing.

[4] Revised to zero.

Australia.—Bismuth mine production in Australia dropped sharply to 930,000 pounds of bismuth in 1975 from a record high in 1974 of 2.6 million pounds. The severe decline was attributed almost entirely to cessation of copper mining by Peko-Wallsend Ltd. at Tennant Creek, in the Northern Territory. Bismuth-bearing copper concentrate from this property was the prime source of Australian bismuth and output is not scheduled to be resumed until there is a substantial increase in the world price for copper. Peko-Wallsend Ltd. also produces a gold-bismuth bullion in the Northern Territory which is shipped via a circuitous route for gold recovery, and ultimate refining of bismuth in the United Kingdom. A lesser quantity of bismuth is also recovered from lead concentrates, produced in Australia, and shipped to other countries for smelting and refining.

Bolivia.—Bolivian production of bismuth in 1975 was 1.5 million pounds, virtually the same as output in 1974. Most of the bismuth was either mined directly from high-grade deposits or produced from complex ore bodies containing copper and tin values. Ore is treated at the Telamayu smelter of Corporación Minera de Bolivia, and a high-grade bullion is shipped abroad for refining. Feasibility studies are being conducted with regard to construction of a Bolivian refinery which would upgrade the entire bismuth production to marketable specification metal.

Canada.—Bismuth is obtained from processing ores containing lead, zinc, copper, molybdenum, or some combination thereof. During 1975, most of the Canadian metal production came from the lead smelter of Cominco Ltd. at Trail, British Columbia, where 81,000 pounds of bismuth was refined. A small quantity was also recovered by Brunswick Mining and Smelting Ltd. Corp., at Belledune, New Brunswick, and Gaspé Copper Mines Ltd. NPL in Quebec.

Japan.—Production of bismuth in Japan continued to drop, from almost 2 million pounds in 1972 to 1.5 million pounds in 1975. The largest part of this downturn was due to a loss of bismuth which traditionally came from Australia, although part of the drop can be attributed to a lower rate of lead smelting and refining during 1975.

Mexico.—Two companies accounted for the entire production of bismuth in Mexico during 1975. A combined total of 981 thousand pounds was produced by Industrial Minera Mexico, S.A., at its Chihuahua, Chihuahua plant, and Industrias Peñoles, S.A., at its Monterrey refinery in Nuevo Léon. Most of the bismuth was refined in Mexico and exported as a finished product, however, some of the metal was shipped in the form of bullion for refining in the United States and the United Kingdom.

Peru.—Production of bismuth during 1975 increased nominally to 1.5 million pounds. Treatment of copper-lead ores at the Oroya works of Minera-Peru continued as the sole source of bismuth in this country. Problems of reorganization under new ownership and curtailment of raw material from Bolivia were believed to be the cause of the drop in 1975 production.

Boron

By J. W. Pressler [1]

In a year of recession and with production cutbacks and inventory adjustments, U.S. production and consumption of boron minerals in 1975 declined slightly compared with that of 1974. However, the total value of sales and captive usage increased to almost $159 million, the largest amount in history. For shipments, it was the first back-to-back yearly decrease since 1961. Exports increased in 1975, inching up over that of 1974. With production being maintained at near peak levels, 25% to 30% capacity increases by major producers were being implemented and scheduled for operation by 1977. An increasing demand for insulation and textile fiberglass, coupled with a 20-year historical trend consumption growth rate of 2.3% in the U.S. borate industry, reinforced the decision of major producers to increase productive capacity commensurately.

The State of California continued to provide the entire U.S. output of boron minerals, mostly as sodium borates and boric acid but more recently some calcium borates. Imports of calcium borate (colemanite) from Turkey in 1975 increased appreciably over that of 1974.

DOMESTIC PRODUCTION

Domestic production and sales of boron minerals decreased very little in 1975 compared with those of 1974. Most of the output continued to come from Kern County, Calif., and to a smaller extent from San Bernardino and Inyo Counties, Calif.

At Boron in Kern County, the large open pit mine and refining plant belonging to U.S. Borax and Chemical Corp., a member of the RTZ Group of London, England, continued to be the world's chief source of boron, although Turkish tincal, colemanite, and refined products are rapidly becoming of great importance in world trade. U.S. Borax now processes over 10,000 tons of ore per day, producing principally crude sodium borate, refined sodium borate and boric acid, and their anhydrous varieties, at the mine site. Crude commercial-grade sodium borates, known as Rasorite 46 (pentahydrate borax) and Rasorite 65, the anhydrous equivalent, represent almost one-half of U.S. Borax's output in tonnage but only about one-third of the value.

---

[1] Physical scientist, Division of Nonmetallic Minerals.

During the year, the $54 million expansion project at Boron continued on schedule with a major portion of the new capacity to be onstream by 1977. This project will provide a 25% to 30% increase in the output of U.S. Borax's primary products, pentahydrate and decahydrate borax. The company's chemical plant at Wilmington, Calif., produced a variety of high-quality specialty borate products with a secondary function of serving as an overseas shipping point for bulk shipments. It was also planned that this chemical facility will be expanded by 25% to meet the increased demand for boric acid, in view of the strong growth projected for a large variety of end uses, including textile fiberglass, heat-resistant glass, cellulose insulation, and fire-resistant cotton batting. At Burlington, Iowa, U.S. Borax has a plant and warehousing facility for compounding, packaging, and distributing household soaps and other consumer products to the East and Midwest United States. These combined operations of U.S. Borax in the United States had an annual capacity of more than 600,000 tons of boric oxide (B_2O_3) equivalent (or about 190,000 tons of contained boron) in 1975, and when planned expansions are completed in 1977, the capacity will be 25% to 30% greater.

The company's production declined slightly during 1975, but with the midyear demand falloff, the company was able to replenish its stocks and concentrate on a substantial maintenance program at Boron, Calif., to restore and improve the production capability of the plants following the difficult period of the long strike in 1974. At the same time, engineering work was undertaken in preparation for a planned increase in production capacity to meet future demands.

U.S. Borax also maintains a warehouse and distribution facility at Botlek, Netherlands, from which borax and boron chemicals are shipped to other parts of Europe.

At Searles Lake, Kerr-McGee Corp. operated the Trona and Westend plants, with combined capacities of approximately 130,000 tons of B_2O_3 equivalent per year. Borates were produced along with potash, soda ash, lithium salts, and sodium sulfate from the mineral-rich brines. The Westend plant has a capacity of 30,000 tons per year of B_2O_3 equivalent as decahydrates. The flowsheet is based upon the carbonation process. At the nearby Trona plant, Kerr-McGee utilizes a differential evaporative process with a productive capacity of 100,000 equivalent tons of B_2O_3 per year, including 150 tons per day of anhydrous borax and 80 tons per day of boric acid. A major new soda ash plant is being constructed adjacent to these existing facilities, but a borate cycle apparently is being deferred until the recovery economics are feasible.

In 1975, Tenneco, Inc., increased production of colemanite and ulexite from its Ryan mine near Death Valley, Inyo County, Calif. The colemanite (calcium borate) is processed at a plant at Lathrop Wells, Nev., utilizing calcination and screening for the principally fiberglass market. The ulexite is trucked to a plant at Dunn, Calif., where it is prepared for the market by grinding to minus 200 mesh. Its principal use is in the manufacture of glass wool insulation and fire-retardant chemicals. At yearend, Tenneco had increased its reserves as a result of exploration and development and had approved a plan to double its production with a capital investment of $20 million within 3 years. However, the environmental impact of increased mining activities in the Death Valley National Monument has resulted in considerable public opposition to any commercial mining, and a bill was introduced in Congress to prohibit any further mineral exploration and mining in the monument. This, of course, has deferred any of Tenneco's plans for future development until it can be resolved.

CONSUMPTION AND USES

Measured in terms of boron content, U.S. consumption was probably about 98,000 tons in 1975, compared with possibly 110,000 tons in 1974 and 114,000 tons in 1973. Beginning with 1975, U.S. consumption of boron materials will be more accurately estimated than in the past. While official U.S. trade statistics will continue to report only exports of refined boron products, with the cooperation of the U.S. producers, crude borate export data will also be made available. These crude product exports have never been reported by the Bureau of the Census.

With these figures, a reasonably accurate consumption figure will be available each year. Only U.S. Borax exported any borates in 1975. Almost 50% of the U.S. output of boron minerals and compounds was exported, while the balance was consumed domestically.

The average annual U.S. consumption of boron compounds during the last 5 years has been roughly 100,000 tons of boron content. About one-half, or 50,000 tons, goes into the manufacture of all kinds of glasses and ceramic uses. Boron materials are used up to 10 weight-percent in most specialty glasses and with an intrinsic value of up to 75% of the total composition. Almost 20,000 tons per year goes into insulating glass wool, which has been gaining sharply as a result of increasing energy costs. High quality and specialty glasses consumed almost 12,000 tons per year, and textile fiberglass consumed over 10,000 tons per year. Enamels, frits, and glazes consumed about 8,000 tons per year for protective and decorative coating on sinks, stoves, refrigerators, and other household and industrial appliances.

The average annual U.S. consumption of boron compounds in soaps and cleaners has been over 12,000 tons of boron content, including about 7,000 tons in sodium perborate detergents used in higher temperature washing. In addition, the chemical derivatives require at least another 10,000 tons per year of boron content. Perborates are used as a bleaching agent or as a source of active oxygen in laundry products. Borohydrides have a growing use as chemical reductants in such important industrial processes as regeneration of sodium hydrosulfite in reductive pulp bleaching. Borax and boric acid uses in the cleansing field include toothpaste, mouthwash, eyewash, etc. Approximately 8,500 tons of boron yearly is used in the manufacture of biological and growth-control chemicals for use in algicides and water treatment, fertilizers, herbicides, and insecticides.

Two minor but important uses—corrosion inhibitors in antifreeze and as fire-retardants—together consume as much as 5,000 tons of boron content per year. Fire-retardant chemicals such as zinc borate are enjoying a very rapid growth in this market.

The list of miscellaneous uses is very diverse: Borates as fluxing material and as shielding slag in the nonferrous metallurgical industry; borate compounds as components in plating baths in the electroplating industry; ferroboron in small amounts in specialty steels; boron in nonferrous alloys such as surfacing metal that is subject to heavy wear; boron nitride compounds as abrasives; boric acid as a catalyst in the air oxidation of hydrocarbons to key nylon intermediates, in the oxidation of paraffins to higher alcohols, as intermediates for surfactants, and as a conditioning agent in the manufacture of ammonium nitrate; various boron products used in pharmaceuticals, paper, textile, leather, nuclear shielding, photography, paints and varnishes, adhesives, and pyrotechnics; and in a few commercial automotive fuels as boron esters to inhibit surface ignition and spark plug fouling.

U.S. demand for boron minerals and compounds is expected to increase substantially in view of the strong growth projected for a large variety of end uses, including textile fiberglass, heat-resistant glass, cellulose insulation, and fire-resistant cotton batting.

PRICES [2]

No U.S. price increases for boron minerals occurred in 1975. In 1974, a series of four increases resulted in raises of from 23% to over 80% during the year, depending on the product. The average value of 1975 borate shipments was $263 per ton of B_2O_3 compared with $207 in 1974. Costs of producing anhydrous products were particularly hard hit by increases in fuel oil and natural gas prices. Although 1975 borate prices remained unchanged, U.S. producers near the end of the year announced price increases of at least 12% to take effect at the beginning of 1976. The sharply rising cost of natural gas for industrial purposes in California was a major factor in the announced price increases. Quoted rounded dollar prices for various borate products are shown in table 2.

FOREIGN TRADE

U.S. exports of boric acid were 33,697 tons valued at $11.5 million in 1975, compared with 35,740 tons in 1974. Exports of refined sodium borate also showed a small decrease—to 212,300 tons valued at $42.5 million in 1975, from 218,107 (revised) tons in 1974. In addition, a large amount of crude sodium borate was exported which was not reported in U.S. trade statistics. Exports of crude sodium borate also suffered from a slackening demand as the result of the recent recession and dropped off about 10% in 1975.

A detailed breakdown of reported exports in 1975 is shown in table 3. Within this table, data for all countries outside Western Europe are fairly accurate. For Western Europe, the Netherlands is a major transshipment point rather than the final destination. A more meaningful tabulation of recipient nations, including an estimate for crude borates, would show that West Germany, France, the United Kingdom, Belgium, and Spain were ahead of the Netherlands, in that order.

In 1975, the United States imported 27,641 tons of commercial-grade colemanite (calcium borate) valued at $1,560,000, all from Turkey. This compared with 21,214 tons, valued at $852,000, in 1974.

WORLD REVIEW

Argentina.—Although borate deposits are known in Bolivia, Chile, and Peru, Argentina remained the only known producer during 1974 and 1975, with borate mineral output each year of 86,000 short tons. Boroquimica, a RTZ Borax Ltd. subsidiary, produced the major portion of the output from its Tincalayu mine in the Salar del Hombre Muerto basin in the Salta region of northwest Argentina. A small production also came from the Compañía Productora de Boratos. Most of the output was consumed domestically, with some exports to other countries in the Latin America Free Trade Area, mainly Brazil.

China, People's Republic of.—The People's Republic of China produces a sufficient but relatively unknown amount of borate minerals, and little is known about the industry. China is understood to have recently built a number of fiberglass plants, which will undoubtedly consume borates in the manufacturing process. This development is in addition to the previously reported construction of a large borax plant at Iksaydam, adjacent to the best known borate occurrence. A moderate output of borate minerals also comes from the playa lake deposits in Sinkiang Province and Tibet, the original source of the first commercial trading of borax minerals with Europe in the 13th century. Small shipments totaling approximately 600 tons of borate minerals were exported to Japan in 1975, while 115 tons of refined products, mostly borates and perborates, were imported from Japan.

Turkey.—Production of borate minerals in Turkey in 1975 was 1,070,000 tons of 27% to 46% B_2O_3 content, the equivalent of 391,000 tons of contained B_2O_3, as provisionally reported by the Turkish Statistical Institute and by the Turkish Mineral Research and Exploration Institute (MTA).

Although 10% less than the record high level of 1974, this plateau represents a doubling of production from the 1973 level of 211,000 tons of contained B_2O_3. Considering ore reserves, present and planned capability, government policy, and the world market for Turkish borates, another major increase in production will take place in the near future.

Turkey now rivals and is a strong competitor of the United States in the production of boron minerals for the world market, and has some transportation cost advantages over the United States in the European market. Refined borax and boric acid are manufactured in the Bandirma and Edincik processing plants of Etibank and exported to all European countries, including the Soviet bloc, and also the Far East, including Japan. In the near future, borax ore mined near Kirka will be processed in an 800,000-ton-per-year complex in the vicinity of the mine. This mine, owned by Etibank, has 96% of the total boron reserves in Turkey.

Etibank, the Turkish Government mining corporation and leading producer with 98% of the boron reserves and more than two-thirds of the production, continued a very aggressive expansion program to produce a variety of refined boron compounds for its traditional European markets. Although some marketing difficulty was experienced during 1975, it was forecast that these markets will recover in 1976. The borate production facilities of Turkey are centered in three principal areas—Kirka, Emet, and Bandirma.

Kirka is located about 45 miles south of Eskisehir in west-central Turkey. Diamond drilling of this tincal deposit was conducted in 1968–69, and possible reserves were estimated at 550 million tons. Mine development by Etibank started in 1970 on ore with an average grade of 26% to 27% B_2O_3 with a trace of arsenic. Shipments of crude ore from Kirka have been the feedstock for the borax and boric acid refinery at the port city of Bandirma, over 200 miles away by rail. A washing and screening plant was established at the mine site in 1974 with an annual capacity of 440,000 tons per year of 35% B_2O_3 upgraded tincal concentrate. Etibank plans to start construction in early 1976 of refining facilities at the Kirka mine site, utilizing the 35% tincal concentrate for the production of 200,000 tons per year of crude borax pentahydrate, 55,000 tons per year of crude anhydrous borax, 19,000 tons per year of refined borax decahydrate, and 10,000 tons per year of refined anhydrous borax. The excess 35% tincal concentrate will continue to be feedstock for the present and expanded refining facilities at Bandirma.

Emet is about 60 miles by air due south of Bursa in west Turkey. Here Etibank has been operating two colemanite mines since 1974—the Hisarcik open pit mine near Emet, and the Espey underground mine, together which have possible reserves of over 11 million tons, the second largest boron reserve in Turkey next to Kirka. Emet is about 150 miles by rail from Bandirma. Etibank has been operating a washing and screening plant at Hisarcik with a feed capacity of 660,000 tons per year of crude colemanite (27% B_2O_3) ore. Ratio of concentration is about 2 to 1, and the plant produces about 330,000 tons per year of upgraded colemanite sized into three products with an average grade of 42% B_2O_3. This product is then shipped by rail to Bandirma for use as feedstock in the chemical refineries, or exported directly to European, U.S., and Japanese markets

At present, about one-half of the tincal concentrate from Kirka and the colemanite concentrate from Emet, received at Bandirma and Edincik, is exported; the balance becomes feedstock for the present and expanding refining facilities. Built in 1968, the Bandirma plant now has a capacity of 60,000 tons per year of refined borax pentahydrate and 28,000 tons per year of refined boric acid. The borax refining plant uses tincal concentrate from Kirka, and the boric acid refining plant uses both Kirka tincal concentrate and Emet colemanite concentrate. A recent refinery addition is a sodium perborate plant with a capacity of 22,000 tons per year. Etibank has finalized plans and initiated construction of four more plants to be finished by 1978 as follows: (1) A second boric acid plant with a capacity of 110,000 tons per year, (2) a second sodium perborate plant with a capacity of 28,000 tons per year, (3) a hydrogen peroxide plant with a capacity of 22,000 tons per year, and (4) an α-hemihydrate byproduct gypsum plant to utilize the waste calcium sulfate from the colemanite processing plants. Thus, it can be seen that Etibank has aggressive plans for expansion of production, including refinery facilities.

The private sector of the borate mining industry has produced 35% to 40% of the total production of Turkey in recent years. However, its reserves at Beyendiler, Salmanli, Camkoy, Farajkoy, Kadikoy, and Calcagi are quite small in comparison with those of Etibank—only 1.54%, or 7.8 million tons, of the total possible reserves of Turkey. Coupled with the large expansion program of Etibank, and government policy relative to private industry in Turkey, their share of borate mineral production will be progressively reduced and will be relegated to a small secondary position. Hence, the talk in recent years of nationalization of the boron industry will be passé.

U.S.S.R.—The borate deposits in the Inder Lake region north of the Caspian

Sea continued to be the major source of the U.S.S.R.'s output in 1975, reportedly at a level approximating 250,000 tons of borate minerals per year. Output is mainly from several deposits in fracture zones around a large salt dome. Although exploration has led to borate discoveries in various parts of the U.S.S.R., the bulk of the production continues to come from the Inder Lake district in Kazakh S.S.R., with some from the Sikhote Alin mountain range in eastern Siberia, northeast of Vladivostok. Apparently, magnesium borate shows a preponderance in production over the sodium and calcium compounds. With the exception of small sporadic imports from Turkey, the U.S.S.R. is self-sufficient in its borate requirements, with some exports to other countries in the Soviet bloc. Estimating the U.S.S.R. production at a level of 250,000 tons per year of borate minerals, domestic consumption could be as much as 220,000 tons per year, with most of the remainder exported to eastern European countries, except for a small amount to Japan (which probably represents production from the Sikhote Alin mountains). In 1975, Japan reported imports of Russian crude borates of 1,720 tons, 2,130 tons of boric acid, and 170 tons of other borates.

Other.—India has recently announced tentative plans for a plant capable of producing up to 200 tons of borax annually from the country's limited reserves,[3] in a sulfur-gypsum deposit in the Ladakh district of northwest India. The only other known production in the world is a small amount of byproduct magnesium borate recovered from potash deposits in West Germany.

TECHNOLOGY

Although it was reported that the Turkish steel industry is using colemanite instead of fluorite for flux in the BOF and open-hearth refining of steel, the U.S. and Canadian steel industry has not gone beyond test runs because of the adverse effect on quality, as any boron entering the steel has a deleterious hardening effect, especially in steel plate. Also, economic incentives are not attractive at this time.

Eagle-Picher Industries of Cincinnati, Ohio, under a contract with the Energy Research and Development Administration (ERDA), will construct a facility for the production of high-purity boron-10 metal powder at Quapaw, Okla.[4] The metal will be used in a wide range of applications where neutron absorption is required. The capacity of the plant will be increased from a nominal 50 kilograms of contained boron-10 per year to over 1,500 kilograms per year.

Bromine

By Charles L. Klingman [1]

The market for bromine was depressed in certain applications in 1975 which resulted in a 6% drop in production. The losses could be attributed to decreased sales of flameproofers for carpets, fabrics, and plastics and to less need for ethylene dibromide, a gasoline additive. There were increases, however, in production of methyl bromide, an agricultural chemical, and in elemental bromine. The higher demand for elemental bromine was a result of greater usage in sanitation and chemicals, plus increased exports.

Despite a lower rate of production, the future market for bromine apparently looked good. Four of the bromine producers announced building programs which should provide sizable increases in capacity within 2 years. A new container for handling bulk shipments of elemental bromine, which was approved by the U.S. Coast Guard in 1975, should facilitate exportation of elemental bromine to all parts of the world.

The average unit price of elemental bromine sold increased 4%, and the unit prices of bromine compounds increased an average of 15% in 1975, compared with the prices of 1974. With higher prices, the 1975 value of elemental bromine plus compounds was greater than that of 1974 despite decreased production.

The future of the bromine industry depends, to a large extent, on the amount of tetraethyl lead allowed by the Federal Government in automobile gasolines. Ethylene dibromide is required as a scavenging agent for the lead whenever it is used. At yearend, the future of lead in gasoline was confused. A lawsuit by the Ethyl Corp. and others against the Environmental Protection Agency (EPA) on this subject was to be appealed to the U.S. Supreme Court. The outcome of this court decision is of critical importance to the bromine industry.

Legislation and Government Programs.—The mainstay of the bromine industry, ethylene dibromide, a gasoline additive, was affected in 1974 and 1975 by regulations of the EPA which virtually precluded the use of lead additives in gasoline for new automobiles. A lawsuit was filed by Ethyl Corp. and others against the EPA claiming that there was no proof that lead in gasoline was a public hazard and that the EPA had exceeded its authority. In 1974, a lower court ruled in favor of Ethyl Corp., but in late 1975, an appeals court reversed the decision in favor of EPA. An appeal to the U.S. Supreme Court was pending at yearend, and the entire matter of lead in gasoline (and its attendant ethylene dibromide) was left unresolved. Regardless of future developments, however, the bromine industry has already felt the effects of the loss of a portion of the gasoline additive business.

In a recent change of position, the EPA withdrew its previous objection to the generation of sulfuric acid by catalytic converters which preclude the use of additives such as ethylene dibromide.

The bromine industry of Arkansas was under investigation in 1975 by a State-appointed Brine Study Commission. Possible pollution problems, royalty rates paid to landowners, and severance taxes were to be analyzed by the committee. At yearend, the study was continuing.[2]

Ethylene dibromide was singled out as a possible carcinogen by the National Cancer Institute, but at yearend no regulations had been issued by a government agency to limit the production or use of this compound.[3]

DOMESTIC PRODUCTION

Total domestic production of elemental bromine decreased 6% in 1975 to 407,163,000 pounds from the 1974 alltime peak. This represented 68% of the nominal production capacity of the industry as reported in the literature.[4] A breakdown of the components of production indicates declines in the manufacture of ethylene dibromide and "other" bromine compounds (including flame retardants) and gains in methyl bromide and elemental bromine. Geographic analysis showed little change in production patterns between 1974 and 1975. Arkansas continued to produce over three-fourths of the national bromine output.

The value of all bromine production, compounds plus elemental, was $5.5 million greater in 1975, an increase of about 3% over the 1974 value. The unit value of elemental bromine increased about 4%, while the average price of the compounds produced increased nearly 15%.

The difference between the quantity of bromine used in the manufacture of compounds (table 1) and the calculated bromine content of the compounds produced (table 2) indicated a loss of about 3.8% in 1975. This was a much greater loss than that evidenced in past years.

Table 1.—Elemental bromine sold as such or used in the preparation of bromine compounds by primary producers in the United States

(Thousand pounds and thousand dollars)

	1974		1975	
	Quantity	Value	Quantity	Value
Sold	45,760	12,177	57,410	15,871
Used	386,334	105,538	349,758	97,255
Total	432,094	117,715	407,168	113,126

Table 2.—Bromine compounds sold by primary producers in the United States

(Thousand pounds and thousand dollars)

	1974			1975		
	Quantity			Quantity		
	Gross weight	Bromine content	Value	Gross weight	Bromine content	Value
Ethylene dibromide	295,070	252,664	66,560	267,523	227,582	69,806
Methyl bromide	20,048	17,472	9,396	24,161	20,336	10,618
Other compounds [1]	157,166	112,510	106,186	124,151	88,611	103,487
Total	472,284	382,646	182,142	415,835	336,529	[2]183,912

[1] Includes hydrobromic acid, tetrabromobisphenol, ethyl, ammonium, sodium, potassium, and other bromides.

[2] Data do not add to total shown because of independent rounding.

From 1% to 2% of the U.S. bromine production is consumed by certain organic chemical industries and is therein reduced to sodium bromide solutions. These waste solutions are sold in bulk to bromine-producing companies which recycle them as plant feedstock.

Elemental bromine sold to nonmanufacturers of bromine compounds amounted to 14% of the production, up from 11% in 1974.

Optimism for the future of the bromine industry seemed to be high as indicated by announced increases in production capacity by four of the bromine producers. Ethyl Corp. planned to build two new plants at a cost of about $15 million. The first, scheduled to be completed in the fall of 1976, was intended for manufacture of intermediate bromine compounds for agricultural chemicals. The second was scheduled to be onstream in the spring of 1977 and was designed for production of the intermediate alkyl dimethylamine, used in the manufacture of germicides, petroleum chemicals, and other specialized products.[5]

---

[4] Chemical Marketing Reporter. Bromine Chemical Profile. V. 209, No. 14, Apr. 5, 1976, p. 9.

Michigan Chemical Corp. announced construction of an additional $9 million facility to manufacture flame retardant chemicals. The plant was scheduled to be in operation by the spring of 1977.[6]

In early 1976, The Dow Chemical Co. was scheduled to bring onstream two new production units at Magnolia, Ark. One of the plants will approximately double Dow's capacity for making elemental bromine, and the other was planned for the production of a brominated soil fumigant for agricultural use.[7]

By the end of 1975, Great Lakes Chemical Corp. was close to completion of its new Marysville, Ark., plant. This plant's capacity was reported to be 45 million pounds of bromine per year. Great Lakes also formed a jointly owned company with a European company, Produits Chemiques Ugine Kuhlmann (PCUK), for marketing flame retardant chemicals in North America.[8]

In 1975, there were 10 bromine-producing plants operated in 3 States by 7 companies. Two of these plants produced elemental bromine only, and one each produced ethylene dibromide, methyl bromide, and inorganic bromides. The remaining five plants produced a variety of compounds and elemental bromine. Two plants in Texas made compounds from purchased bromine and hence were not primary producers.

Three bromine companies produced 82% of the U.S. output. Table 3 lists the current bromine producers of the United States.

U.S. resources are vast, although their full potential is unknown. If the rich brine sources should fail, there are unlimited reserves of dilute bromine in the oceans.

Table 3.—Bromine-producing plants in the United States

Morton Chemical Co	Manistee	Manistee	Do.

CONSUMPTION AND USES

Ethylene dibromide output dropped 9% in 1975 compared with that of 1974; this was in addition to a drop of 12% between 1974 and 1973. The decrease in consumption of ethylene dibromide, a gasoline additive, was due to mandatory changes in 1974–75 automobiles which precluded their use of "leaded" gasoline. When tetraethyl lead was not used, there was no need for ethylene dibromide in gasoline. The decrease in consumption of ethylene dibromide may continue in future years.

There was also a distinct drop in consumption of "other" bromine compounds which included hydrobromic acid, the bromides of sodium, potassium, and ammonia, and a host of organic bromides. Flame retardant bromides dropped in 1975, probably because of reduced output of synthetic fibers, carpets, rugs, and plastics in which flameproofers were used. One source[9] predicted, however, that flameproofer demand will increase about 40% by 1980. Strict governmental standards for flammability have been a factor in creating this bromine market.

[8] News Release by Great Lakes Chemical Corp. Feb. 2, 1976, and Feb. 20, 1976.

Methyl bromide, used primarily as a soil sterilant, showed a 4.1-million-pound gain in 1975. Since 1962, production of methyl bromide has displayed an average annual growth of 7%. Much of this new production was apparently exported from the United States.

Sales of elemental bromine also showed an increase of 11.7 million pounds in 1975, 2.7 million of which could be attributed to increased exports. Elemental bromine was used as a disinfectant, algaecide, a chemical oxidizer, and, of course, as an ingredient in the manufacture of bromine compounds.

PRICES

The average price of bulk elemental bromine f.o.b. plant as reported by producers in 1975 was 27.65 cents per pound, 4% higher than the 1974 average price. This increase was less than the industry-wide rate of inflation, however, so the effective bromine price on a constant-dollar basis was lower in 1975 than in 1974.

Prices quoted in the Chemical Marketing Reporter as of December 29, 1975, for bromine and certain of its compounds are shown in the following tabulation:

	Value per pound (cents)
Bromine; purified:	
Carlots, truckloads, delivered	75
Drums, carlots, truckloads, delivered east of Rocky Mountains	55–62
Zone I: [1] Bulk tank car, tank trucks (45,000-pound minimum), delivered	25–30
Ammonium bromide, national formulary (N.F.), granular, drums, carlots, truckload, freight equalized	74
Bromochloromethane, drums, carlots, freight equalized	73
Tanks, same basis	71
Ethyl bromide, technical, 98%, drums, carlots, freight allowed, East	61½
Ethylene dibromide, drums, carlots, freight equalized	37
Methyl bromide, distilled, tanks, 140,000-pound minimum, freight allowed	41
Potassium bromate, granular, powdered, 200-pound drums, carlots, f.o.b	106
Potassium bromide, N.F., granular, drums, carlots, f.o.b	67
Sodium bromide, 99% granular, 400-pound drums, freight, F.o.b	65

[1] Delivered prices for drums and bulk shipped west of the Rockies, 1 cent per pound higher. Bulk truck prices 1 cent per pound higher for 30,000-pound minimum and 2 cents per pound higher for 15,000-pound minimum. Price f.o.b. Midland and Ludington, Mich., freight equalized 1 cent per pound lower.

FOREIGN TRADE

The entire amount of bromine exported from the United States in 1975 (both as the element and that contained in compounds) dropped about 6% below the 1974 total, but the value of the exports increased around 10% owing to a rise in prices. The total value of exported compounds was about 25 times that of the elemental exports. Exported compounds dropped about 12% in quantity, in contrast with a 296% gain in exported elemental bromine. The total amount of bromine exported remained at about 16% of the total domestic bromine production.

In 1975, approval was obtained from the U.S. Coast Guard for the use of a new container for elemental bromine which should facilitate overseas shipments of liquid bromine.

Imports of bromine remained too small to tabulate, amounting to less than one-half percent of domestic production. About 70% of the imports came from Canada.

WORLD REVIEW

Israel.—Dead Sea Bromine, Ltd., reportedly will increase its bromine production capacity to 55,000 tons (110 million pounds) per year by 1979 by building a new 27,500-ton-per-year chlorine plant in Israel.[10]

The Dead Sea Co. also announced that it would build a new $12 million plant at Terneuzen, the Netherlands, to produce 7,500 tons of bromine compounds per year from Israeli bromine. A tariff-reducing agreement with the European Economic Community facilitated the decision.[11]

Table 5.—Bromine: World production, by country[1]
(Thousand pounds)

Country[2]	1973	1974	1975[p]
France	36,685	35,009	[e] 33,000
Germany, West	[e] [r] 9,900	11,581	9,414
India[e]	550	600	600

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Owing to incomplete reporting, this table has not been totaled.

[2] In addition to the countries listed, several other nations produce bromine (including most notably, the U.S.S.R.), but output data are not reported and no basis is available for estimation of output levels.

[3] Elemental bromine from thermal and marine waters only: Additional bromine may be produced in the form of compounds and/or as elemental bromine from other sources.

TECHNOLOGY

Bromine chloride was being investigated as an improved chemical for water treatment. It was found to be less toxic than chlorine alone and possibly more effective as a disinfectant. If accepted by the water treatment industry, it could provide a large new market for bromine.[12]

Michigan Chemical Corp., opened a new technical center at Ann Arbor, Mich., in which development work will be conducted on new products, production methods, and quality control.

A new bromine chapter of the Bureau of Mines publication, Mineral Facts and Problems, was written in 1975; it covers such aspects as industry structure, supply and demand, etc., and predicts demand for bromine to the year 2000.[13]

Cadmium

By Ronald J. DeFilippo [1]

In 1975 cadmium metal production in the United States declined for the third consecutive year with output at the lowest level since 1938. Apparent consumption reached the lowest level since 1940. Imported cadmium metal, not including the cadmium content of imported flue dusts and zinc concentrates, provided 41% of the total U.S. supply, compared with 26% in 1974. There were no sales of government stockpile excesses by the General Services Administration (GSA).

Seven plants and six companies accounted for the total domestic primary production. The producer price decreased from $4.25 per pound at the beginning of the year to $2.00 at yearend.

Legislation and Government Programs.—There were no sales of cadmium by GSA in 1975 from national stockpile excesses. At yearend the total inventory stood at 3,233 tons. The stockpile objectives remained at 2,223 tons, and the quantity available for public disposal was 227 tons. Exploration assistance for cadmium was offered by the Office of Minerals Exploration, with 50% of allowable costs furnished by government participation. No contracts were sought or active in 1975. Depletion allowances were 22% for domestic mines and 14% for mines in foreign countries.

r Revised.

[1] Primary and secondary cadmium metal. Includes equivalent metal content of cadmium sponge used directly in production of compounds.

[2] Includes metal consumed at producer plants.

[3] Average quoted price for cadmium sticks and balls in lots of 1 to 5 tons.

DOMESTIC PRODUCTION

Domestic cadmium metal production was 483 tons in the first quarter, increased to 621 tons in the second quarter, and declined in the fourth quarter to 587 tons. Total cadmium metal production for the year was 2,193 tons, down 34% from that of 1974. Metal production was nearly three times greater than metal shipments, which were 75% below those of 1974.

Cadmium sulfide production (including cadmium sulfoselenide and lithopone) declined 9% from that of 1974; this was only about one-fourth the rate of decline for metal production.

Smelter recovery of cadmium averaged about 10 pounds of cadmium per ton of slab zinc produced, nearly the same as in 1974.

Cadmium oxide was produced by two of the seven primary metal producing plants. One plant reported secondary production, which was remelted metal or refined cadmium sponge.

1975	987

[1] Cadmium oxide withheld to avoid disclosing individual company confidential data.

[2] Includes cadmium lithopone and cadmium sulfoselenide.

CONSUMPTION AND USES

Actual consumption data are not gathered by the Bureau of Mines. The apparent consumption of cadmium, 3,341 tons, was 45% below that of 1974. Metal used for electroplating hardware used in transportation vehicles and stationary mechanical and electrical equipment accounted for slightly less than half of total domestic cadmium consumption. Cadmium compounds used for red, orange, and yellow pigments and other compounds used as plastics stabilizers accounted for an additional one-third of U.S. cadmium consumption. The remainder of consumption was accounted for by cadmium metal and compounds used in alloys, nickel-cadmium batteries, and specialized electronics devices.

Table 4.—Supply and apparent consumption of cadmium
(Short tons)

	1974	1975

Distributors	136	41	213	34
Total	999	570	2,419	422

W Withheld to avoid disclosing individual company confidential data; included with "Compound manufacturers."

PRICES

The producer price for cadmium was $4.25 per pound at the beginning of the year. On June 6, National Zinc Co. cut prices, leading to a cadmium quote of $3 per pound by the end of June by all dealers. In September there was another round of price reductions with St. Joe Minerals Corp. taking the lead. By September 17 all U.S. producers were quoting a price of $2.50 per pound. On December 2 St. Joe cut the cadmium price to $2 per pound, and the other primary producers quickly followed. This was the lowest price for cadmium since January 1972.

Domestic dealer prices started the year at around $2.60 per pound and held at this level until the June producer price cut. Dealer prices then began to decline, to about $2.30 per pound by the end of September and to $1.85 to $1.90 by yearend. European dealer prices were considerably under U.S. dealer prices at the beginning of the year, but by yearend the two prices were identical.

Table 6.—Cadmium prices, 1975

(Dollars per pound)

Date	Producer price, 1- to 5-ton lots
Jan. 1 to June 6	4.25
June 6 to June 26	3.00–4.25
June 26 to Sept. 9	3.00
Sept. 9 to Sept. 17	2.75–3.00
Sept. 17 to Dec. 1	2.50
Dec. 1 to Dec. 8	2.00–2.50
Dec. 8 to Dec. 31	2.00

FOREIGN TRADE

Exports of cadmium metal and scrap increased from 31 tons in 1974 to 198 tons in 1975. The principal recipient countries were Belgium, 54%; the Netherlands, 30%; and Japan, 7%.

Imports of cadmium metal were up 32% over those of 1974. Belgium-Luxembourg was the largest supplier of metal with 23% of the total, followed by Australia, 15%; Canada, 11%; West Germany, 9%; Zaire, 8%; Mexico, 8%; Peru, 7%; and Spain, 5%. Mexico, the sole foreign supplier of cadmium-containing flue dust, more than doubled its exports to the United States in 1975 compared with 1974.

Table 7.—U.S. exports of cadmium metal and cadmium in alloys, dross, flue dust, residues and scrap

Year	Quantity (short tons)	Value (thousands)
1973	153	$598
1974	31	288
1975	198	589

[1] 1974 and 1975 general imports and imports for consumption were the same.

[2] Less than ½ unit.

WORLD REVIEW

World smelter production of cadmium was 11% below that of 1974. Japan and the United States were the largest cadmium producers with 17% and 13%, respectively, of the world total. Following in percentage of production were Canada, 8%; West Germany, 7%; Belgium, 6%; and the 23 remaining producing countries, 49%. Apparent consumption in the United States was 19.8% of the world production.

New zinc smelters and expansion plans that were underway and scheduled for completion by 1976 in India, Japan, Mexico, and the United States would raise world zinc production capacity by about 260,000 tons. Based on an optimal estimated recovery ratio of 10 pounds of cadmium per short ton of slab zinc production, this increase could provide a potential for about 1,300 tons of additional cadmium production compared with 1974 capacity.

European and Japanese cadmium producers formed the International Cadmium Institute (Incadin) at Brussels, Belgium, in March and held their first working meeting in June. The objectives of Incadin were to collect and distribute information on cadmium usage and to stimulate cadmium consumption.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Table gives unwrought metal production from ores, concentrates, flue dusts, and other materials of both domestic and imported origin. Sources generally do not indicate if secondary metal (recovery from scrap) is included or not; where known this has been indicated by footnote. Data derived in part from World Metal Statistics (published by World Bureau of Metal Statistics, London) and from Metal Statistics (published by Metallgesellschaft Aktiengesellschaft, Frankfurt am Main). Cadmium is produced in ores, concentrates, and/or flue dusts in a number of other countries, but these materials are exported for treatment elsewhere to recover cadmium metal; therefore, such output is not recorded in this table to avoid double counting.

[2] Includes secondary.

[3] Output of Tsumeb Corp. for calendar years.

TECHNOLOGY

As in past years, there was continued interest in abating environmental cadmium dispersal. Several processes were devised to remove cadmium from industrial effluent. One process utilizes a reagent such as sodium sulfide, ammonium polysulfide, or hexanethiol, the effluent and reagent are passed through peat, on which the insoluble metal sulfide precipitates for later recovery as an oxide by drying and furnace oxidation of the peat.[2] Another method utilizes algae of the genus *Chlorella* to extract cadmium from wastewater. It was found that cadmium levels were reduced from 200 parts per million (ppm) to 8.6 ppm.[3] A third method uses aldehyde-dithiocarbamate or aldehyde-dithiocarbamate-aromatic compounds to selectively adsorb heavy metals such as cadmium and zinc.[4] A fourth method of wastewater treatment utilizes ground coral to absorb cadmium and other heavy metal ions. The exhausted material can then be dried and used as an aggregate or regenerated by chemical or thermal methods with recovery of the cadmium.[5]

One study of atmospheric dispersal of cadmium and other trace metals suggested that much or all of the high cadmium levels observed over the North Atlantic were from natural sources.[6]

The geochemical dispersal patterns of zinc and cadmium were studied in reservoir sediments downstream from mine workings; it was found that the heavy metals tended to concentrate in the deepest sediments.[7] The behavior of cadmium and other metals was investigated in a marine estuary at Back River, Md. It was found that within 1.2 to 1.9 miles of a wastewater treatment plant outfall the cadmium concentration dropped from 3.5 milligrams per liter (mg/1) to 0.5 mg/1 as the cadmium precipitated. However, cadmium concentration increased downstream, presumably as conditions changed and the cadmium reentered solution.[8]

The sources and pathways by which cadmium is consumed by humans were also investigated. Cadmium levels which are considered hazardous were also discussed.[9]

The toxicology of cadmium was explored in a review of the biological and biochemical effects of the metal and its compounds with a summary of the methods for monitoring cadmium exposure.[10] Health and safety precautions were also outlined in an article which suggested that the threshold limit for cadmium metal and soluble salts in the air should be 0.2 milligram per cubic meter (mg/m^3), and for soluble cadmium fume in air, 0.1 mg/m^3.[11]

A report was published by the Environmental Protection Agency (EPA) that explored (1) present real dangers to man and the environment, (2) sources of cadmium entering the environment, (3) control alternatives that may be technologically and legally feasible, and (4) the present and projected role of cadmium in the U.S. economy and the impact of proposed control measures. It was found that there was no definite correlation between cadmium dissemination and chronic diseases. Also it was found that of the total amount of cadmium released by man, 20% is accountable to the primary nonferrous metals industry (mining and smelting); 30% is due to the conversion, use, and disposition of cadmium; and the remaining 50% is inadvertent (for example, from fossil fuels, fertilizers, and sewage sludge). It was concluded that only 15% of cadmium emissions are in the form of air pollution; the remainder is in land-destined wastes, only 10% of which are in concentrations greater than 0.1%.[12]

Overcoming problems associated with the cadmium plating of steel was the subject of several studies. The addition of sodium carbonate to the plating bath was found to reduce the dissolution of the cadmium deposit.[13] Another study found that a plating current density of 22 amperes per square foot was the optimum value for titanium-cadmium plating.[14] One firm adopted a mechanical plating process for its entire plated production. The particular process, developed and owned by the Minnesota Mining and Manufacturing Co., avoids electroplating embrittlement problems and is virtually pollution-free.[15]

Electrodeposits of a cadmium alloy containing 14% gold and 11% copper could be used as a reliable electrical contact material.[16]

Beryllium, tin, and cadmium (1.1%) added to a white metal bearing alloy were found to substantially increase the mechanical strength of the alloy.[17]

A photoconductive material comprised of fine cadmium sulfide and cadmium carbonate particles on a silicate base was found to have good performance under conditions of high ambient temperature and humidity.[18]

A method of manufacturing a negative battery electrode with a cadmium powder-cadmium oxide slurry applied to a nickel screen was developed. The cell has a desired amount of precharge even in an uncharged condition.[19] Another method makes electrodes by sintering nickel powder with anhydrous cadmium fluoride or potassium cadmium fluoride for use with an alkaline electrolyte.[20] Lead-acid and nickel-cadmium batteries were compared for ampere-hour efficiencies and were quoted at 90% and 72%, respectively.[21]

Calcium and Calcium Compounds

By Avery H. Reed [1]

Calcium metal was manufactured by one company in Connecticut. Calcium chloride was produced by two companies in California and three companies in Michigan. Synthetic calcium chloride was manufactured by three companies in New York and Washington.

DOMESTIC PRODUCTION

Pfizer Inc. produced calcium metal at Canaan, Conn., by the Pidgeon process, in which quicklime and aluminum powder are heated in vacuum retorts; at a temperature of 1,170° C, calcium vaporizes and it is collected at one end of the retort.

National Chloride Co. of America and Leslie Salt Co. produced calcium chloride from wells in San Bernardino County, Calif. Output declined 13%. The Dow Chemical Co., Michigan Chemical Corp., and Wilkinson Chemical Corp. recovered calcium chloride from brine, in Gratiot, Lapeer, Mason, and Midland Counties, Mich. Output declined 20%. Total production of natural calcium chloride was 594,000 tons, 20% below the 1974 record.

Allied Chemical Corp. recovered synthetic calcium chloride as a byproduct of soda ash at Syracuse, N.Y.; Reichold Chemicals, Inc. recovered synthetic calcium chloride as a byproduct of pentachlorophenol manufacture at Tacoma, Wash.; and Hooker Chemicals & Plastic Corp. manufactured calcium chloride at Tacoma using limestone and hydrochloric acid. Total output of synthetic calcium chloride was 234,000 tons.

The total value of all calcium chloride sold in 1974 was a record high of $44 million.

CONSUMPTION AND USES

Calcium metal was used as a reducing agent to separate metals such as columbium, tantalum, thorium, titanium, uranium, vanadium, and zirconium from their oxides; to form alloys with aluminum, lead, lithium, magnesium, and silicon; as a scavenger in the steel industry; and in the manufacture of calcium hydride. A potentially important use for calcium metal is in a new storage battery that requires no water to be added.

The principal use for calcium chloride was to melt snow and ice from roads, streets, bridges, and pavements. Calcium chloride is more effective at lower temperatures than is rock salt and is mainly used in the northern and eastern States. It was also used to keep down dust on roads and driveways, and as an accelerator for concrete.

PRICES AND SPECIFICATIONS

Prices for calcium metal ranged from $1 to $5 per pound. Calcium chloride is usually sold either as solid flake or pellet averaging about 75% $CaCl_2$, or as a concentrated liquid averaging about 40% $CaCl_2$. On a 75% basis, the average value in 1975 for natural calcium chloride was $48.87 per ton; and the average value for synthetic calcium chloride was $64.72 per ton.

FOREIGN TRADE

Exports of calcium chloride, mainly to Canada and Mexico, totaled 28,400 tons valued at $2,314,000, compared with 30,900 tons valued at $1,699,000 in 1974. Exports of dicalcium phosphate were 21,100 tons valued at $6,270,000; leading destinations were Canada, Taiwan, and Thailand. Exports of precipitated calcium carbonate, mainly to Canada and Mexico, were 4,640 tons valued at $705,000.

Total imports of calcium and calcium compounds were 228,300 tons valued at $17,530,000. Imports of calcium metal from Canada, the U.S.S.R., and France totaled 35 tons valued at $77,700. Imports of calcium chloride, mainly from Canada, were 12,000 tons valued at $598,000. Imports of other calcium compounds, mainly from Norway, Canada, Turkey, and France totaled 216,200 tons, valued at $16,850,000.

Imports of other calcium compounds included 94,950 tons of calcium nitrate from Norway, Canada, Sweden, the United Kingdom, and New Zealand; 57,420 tons of calcium cyanamide from Canada and West Germany; 27,640 tons of calcium borate from Turkey and Sweden; 20,120 tons of whiting from France, the United Kingdom, Belgium, and Switzerland; 5,440 tons of calcium carbide from Canada; 1,563 tons of precipitated calcium carbonate from the United Kingdom, Japan, Canada, West Germany, and the Netherlands; 1,379 tons of calcium hypochlorite from Japan; 1,040 tons of calcium cyanide from Canada and Mexico; and 6,656 tons of other compounds, mainly from the United Kingdom, Canada, and West Germany.

Table 1.—U.S. imports for consumption of calcium and calcium chloride

Year	Calcium		Calcium chloride	
	Quantity (pounds)	Value	Quantity (short tons)	Value

United Kingdom	20	9,074
Total	12,021	597,758

WORLD REVIEW

Canada.—Chromasco Corp. Ltd. produced calcium metal at its Haley smelter near Renfrew, Ontario. Canada continued to lead all other countries in the production of calcium metal. About 25 tons valued at $51,000 was exported to the United States. Canada was the leading source of U.S. imports of calcium chloride.

France.—Planet Wattohm S.A., a subsidiary of Compagnie de Mokta, produced calcium metal by the Pidgeon process. About 3 tons valued at $15,000 was exported to the United States.

U.S.S.R.—Some calcium metal was produced in the U.S.S.R. Seven tons of Soviet calcium metal valued at $12,000 was exported to the United States.

TECHNOLOGY

The use of calcium metal could increase if the new "maintenance free" automotive batteries prove to be a commercial success. These batteries use calcium-lead alloy instead of antimonial-lead alloy. They are hermetically sealed and require no addition of water during the life of the battery.

Carbon Black

By Herbert L. Franklin [1]

The carbon black industry is heavily dependent on one industrial sector; namely, rubber manufacturing. Since 1950, the rubber industry has consumed, on the average, 94% of all carbon black output. This trend continued in 1975. During the year rubber manufacturers, suffering a 10% reduction in sales because of the general economic recession, cut back carbon black purchases by 12.7%. This figure corresponds very closely with the average drop in domestic carbon black sales of 13.3%. However, the overall drop in carbon black sales was aggravated somewhat by even greater cutbacks in consumption by a group of small-scale users including the chemical, food, metallurgical, and plastics processing industries.

Following the trend of reduced sales, production also dropped sharply in 1975; output was only about four-fifths that of 1974. During this off year, plant expansion was minimal and an overall drop of about 4% in productive capacity occurred; the only significant shutdown reported was the closing of Cabot Corp.'s thermal facilities at Franklin, La.

Greater use of the oil furnace process was reflected in the increased proportion of oil furnace blacks processed during 1975; production increased from approximately 83% of the total output in 1974 to nearly 87% during 1975. The increased share of oil furnace blacks took place at the expense of Semireinforcing Furnace black (SRF) and thermal black grades. The largest proportionate drop occurred in thermal blacks, which declined from 8% of the 1974 total to 4.4% of the 1975 output, reflecting, in part at least, the loss of Cabot thermal production at Franklin, La.

Although the average yields from liquid hydrocarbons dropped slightly during 1975 and average output from natural gas increased, the trend toward greater proportional use of liquid hydrocarbons continued. In 1974, liquid hydrocarbons accounted for 94.7% of total output, and in 1975, they accounted for 95% of U.S. production. This trend is easily explained in terms of cost as the average cost of carbon black produced from liquid hydrocarbons in 1975 was 5.16 cents per pound and that from natural gas was 13.38 cents per pound.

Shipments continued the downward trend begun in 1974 and plunged to 2,804 million pounds, the industry's lowest level since 1969. Movements to foreign consumers dropped to an even greater degree than to domestic buyers; in 1974 exports accounted for 5.8% of all carbon black shipments while in 1975 they made up only 3.1% of the total. Imports, totaling 33.5 million pounds, were up about 11% over the 1974 level. The principal sources of these imported carbon blacks in order of significance were Canada, Indonesia, and West Germany accounting for 86%, 10%, and 3.5%, respectively; the remainder came from other West European countries and Kenya. Small amounts of lampblack were imported from West Germany and Indonesia, and a very small quantity of bone black was purchased from Canada.

Carbon black prices increased from an average of 11.87 cents per pound in January 1975 to 12.75 cents per pound in April or about 7.4%. By June 1975, the depressed carbon black market forced prices for most grades back down to their January 1975 levels. The only exception was thermal blacks, which retained their average post-April levels of 12 cents per pound. Channel blacks held their January prices throughout the year. Producers being squeezed between escalating production costs and a depressed market looked for means other than price increases to retain their profit margins or reduce losses; to accomplish this, many focused attention on cost reduction through improved operating efficiency, particularly by lowering energy consumption.

[1] Excludes channel black.

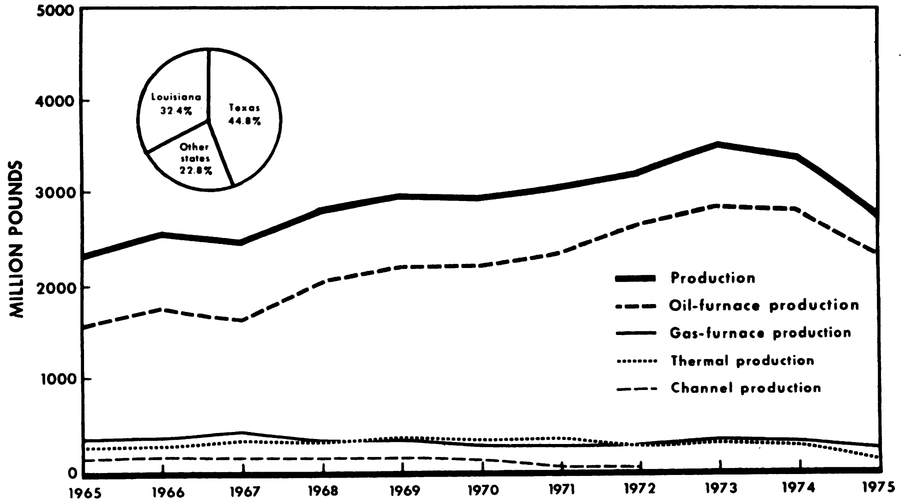

Figure 1.—U.S. production by process and geographic area.

PRODUCTION AND CAPACITY

Production by State.—Carbon black production, totaling 2,742 million pounds plus an undisclosed amount produced by the channel process, dropped sharply from the 3,390 million pounds in 1974. This drastic reduction of approximately 19% was attributable in general to the economic recession and most notably to the decline in demand for automobile tires. Production facilities in Texas and Louisiana, near sources of energy and feedstocks, accounted for about 77% of the national production. The remaining domestic output came from Arkansas, California, Kansas, Ohio, Oklahoma, and West Virginia.

Production by Grade and Type.—Carbon black was produced principally by furnace combustion processes, which accounted for 95.6% of reported national production; the remainder was produced by thermal cracking methods. An undisclosed but presumably small quantity of channel black was also produced during the year. The channel production process has been declining steadily in importance and in 1973, the last year for which data are available, accounted for less than 1% of total output. The declining significance of the channel process can be attributed principally to relatively low yields and rising gas prices; however, the low priority assigned to natural gas for use as a raw material in carbon black manufacturing can also be considered a significant contributing factor. High Abrasion Furnace (HAF), General Purpose Furnace (GPF), and Fast Extruding Furnace (FEF) blacks together accounted for 78% of national production; notably, all of these grades are derived from liquid hydrocarbons. The finer particle Intermediate Superabrasion Furnace (ISAF) and Superabrasion Furnace (SAF) grades, also processed from liquid hydrocarbons, made up 8.8% of total production. SRF and the relatively coarse thermal blacks, both based on natural gas feedstocks, declined in significance as their combined share of total output decreased from 17.3% in 1974 to 13.3% in 1975.

Number and Capacity of Plants.—During 1975, 32 carbon black plants were operating in the United States. All but one were furnace black facilities, the other was a channel black plant. Total daily production capacity of furnace black plants dropped to 11.16 million pounds, a decrease of 4.2% from reported capacity of 1974. The reduction in daily output capability can be partially explained by the closing of Cabot Corp.'s thermal processing capacity at Franklin, La. The remaining capacity reduction can only be attributed to changes in feedstock mixes and product output.

Although aggregate figures indicated a net drop in productive capacity, additional capacity was added at a few plants. Phillips Petroleum Co. completed expansion activities at its production facilities in Borger and Orange, Tex., and at Toledo, Ohio. The expansions added approximately 156,000 pounds of daily throughput capacity to Phillips domestic facilities. Other development activities in the carbon black industry focused mainly on developing alternate fuels capability, reducing energy consumption, and other measures to improve operating efficiency.

Materials Used and Yields.—During 1975, liquid hydrocarbons increased their dominance as a feedstock for production of carbon black. About 517.4 million gallons of liquid hydrocarbons were used to manufacture 2,606 million pounds of carbon black or 95% of the total domestic output. Natural gas continued its decline in significance as quantities used were 35% less than in 1974; about 26.2 million cubic feet were consumed in producing 136 million pounds of carbon black. Yields from liquid hydrocarbons dropped slightly to 5.04 pounds per gallon, interrupting the increasing trend that has prevailed for the past 5 years. Conversely, yields from natural gas increased to 5.19 pounds per thousand cubic feet in 1975, after a significant drop in average output during the preceding year. Another significant trend to follow when comparing the two types of raw materials used is the relative cost of each input. The average cost of liquid hydrocarbons for each pound of carbon black production increased from 1.73 cents in 1973 to 5.16 cents in 1975. Natural gas costs ranged from 4.88 cents per pound in 1973 to 13.38 cents per pound in 1975.

CONSUMPTION AND USES

The carbon black industry, heavily dependent on rubber production for its survival, continued its dependency as sales to the rubber industry amounted to 93.6% of total sales in 1975. Varying amounts and grades of carbon black are used for the many parts of a tire depending on the qualities needed; overall, carbon black makes up about one-fourth of a tire's total weight. Passenger vehicle tires contain 6 to 7 pounds each and truck tires require about 20 pounds per tire. A significant amount of carbon black is also used in a large number of other rubber products such as hoses and belts needed by the automotive and other industrial sectors. The remaining carbon black sales in 1975 were spread over a number of industries including ink, paint, paper, chemical, food, metallurgical, and plastics. Because of the general economic recession that continued into 1975, total domestic sales of carbon black dropped about 13% below the level of 1974. This overall decline corresponds closely with the reduction in sales to rubber manufacturers, but substantially sharper drops in demand by some of the smaller consumers aggravated the carbon black sales situation slightly.

STOCKS

At the close of 1975, producer's stocks had dropped to 231.7 million pounds, about 21% less than the 1974 yearend level. This figure approximates the yearend inventory levels of 1972 and 1973. Channel black stocks held at yearend were not reported.

A significant drawdown occurred in each grade of carbon black except the ISAF blacks, which increased 2%. The largest depletions occurred in the thermal stocks, which dropped nearly 50%, and the supply of FEF blacks, which was 48% lower than at the beginning of 1975. The HAF blacks, most active in trading with 43% of the shipments reported during the year, also retained the largest inventory at yearend, or 41% of all carbon black stocks on hand.

FOREIGN TRADE

Exports of carbon black, as reported by the Bureau of Census, dropped to 87.9 million pounds in 1975. About 40% of the U.S. exports went to Europe where the United Kingdom, France, and West Germany were the principal recipients. North American consumers, principally Canada and Mexico, received nearly one-fourth, and Asian countries purchased about 21% of the total.

Carbon black imports totaled approximately 33.5 million pounds in 1975. Almost 86% of these came from Canada, and 10%, from Indonesia. The remainder came mostly from West European producers. The United States also imported 69,300 pounds of bone black from Canada during the year and 377,518 pounds of lampblack from Indonesia and West Germany.

Exported carbon blacks averaged 17.6 cents per pound in 1975 compared to 12.5 and 16.3 cents per pound in 1973 and 1974, respectively. Imported carbon blacks cost U.S. consumers an average price of 12.97 cents per pound in 1975; comparative costs for 1973 and 1974 were 11.4 and 14.6 cents per pound, respectively. Imported bone blacks averaged 11.0 cents per pound, and lampblack was purchased at an average price of 41.2 cents per pound.

WORLD REVIEW

World production of carbon black decreased about 12% in 1975. Output dropped most sharply in the highly industrialized societies of the United States, and Western Europe. Productivity remained fairly stable in Eastern Europe and even increased slightly in some developing countries of Latin America and the Far East. Despite relatively large decreases in production, the United States, Japan, and Western Europe continued their dominance of the world market, collectively accounting for about four-fifths of worldwide output.

Although worldwide demand for carbon black generally plummeted during 1975, expectation of an improved market in 1976 and continued but slow growth over the long term, induced some capacity expansion and new construction.

Most development activity took place in Latin America and in the Far East, thus reflecting the belief of some industry leaders that carbon black consumption will grow more rapidly in developing regions than in the well-established industrial markets. Presumably, as the developing regions prosper, their local demand for automobiles and associated rubber products, mining equipment, and industrial machinery, will grow more rapidly than that in the more stable, established industrial markets.

Demand remained high during the year in Brazil, and Companhia Petroquimica Brasileira increased the capacity of its São Paulo plant to 160 million pounds per year. Other Brazilian activities included construction of a 72.7-million-pound-per-year plant at Candeias and another facility of undisclosed capacity at Capuava, near São Paulo. In Mexico a 13.2-million-pound-per-year plant was completed at Salamanca, and plans were made to construct an 80-million-pound-per-year furnace black facility in Tampico; the Tampico facility will be completed in 1976. United Carbon of Venezuela is also expanding its production facilities. In the Far East, expansion or new construction was underway in the Republic of Korea, India, and Malaysia. The facility under construction at Durgapur, India, will have a throughput capacity of 17.5 million pounds per year; projected output capacity of the other plants is not known. During the year, a 6.6-million-pound-per-year plant was completed at Kurnell, Australia.

In the more industrialized foreign countries, development activities focused mainly on improving operating efficiency, particularly in the area of energy consumption. In one expansion activity, however, Cities Service Co.'s Columbian Div. was reportedly building a sixth production unit at its Hamilton, Ontario, furnace black plant. Ashland Chemical Co. closed a plant at Speyer, West Germany.

TECHNOLOGY

Carbon black, a petrochemical, is an extremely fine soot, primarily carbon (90% to 99%), that contains some hydrogen and oxygen. Oil furnace black may also contain small amounts of sulfur. Properties of carbon black are determined largely by the process of manufacture. Furnace black, which accounts for 99% of all carbon black produced, is made by three different processes—gas furnace, oil furnace, and thermal. Oil furnace processes accounted for 87% of all furnace black output in the United States during 1975; gas furnace production made up 9%, and thermal output dropped to 4% of the total. Brief descriptions of these processes, the channel process, and the manufacture of lampblack follow.

Gas Furnace.—The gas furnace process is based on partial combustion of natural gas in refractory-lined furnaces. Carbon black is removed by flocculation and high-voltage electric precipitators. Yields of gas furnace blacks range from 10% to 30% and are lowest for the smaller particle-size grades. Properties of gas furnace blacks can be modified to a degree by changing the ratio of air to gas. High-Modulus Furnace (HMF) and SRF grades are generally produced from gas.

Oil Furnace.—Liquid hydrocarbons are used in the oil furnace process. Natural gas is generally burned to furnish the heat of combustion, and atomized oil is introduced into the combustion zone to be burned to various grades of carbon black. Yields range from 35% to 65%, depending on the grade of black produced. Oil furnace grades are FEF, GPF, HAF, ISAF, and SAF.

The most desirable feedstock oil for furnace black plants has 0° to 4° API gravity, is low in sulfur, and is high in aromatics and olefins. It comes from near the "bottom of the refinery barrel" and is similar in many respects to residual fuel oil. Rising costs of natural gas have influenced the shift to a greater use of liquid feedstocks and a corresponding decline in the use of natural gas as a source of carbon. Oil furnace processing has become highly flexible, supplementing channel blacks in most high-performance applications, notably passenger car tires. Carbon black technology centers on the oil furnace black process. One recent study concluded that by injecting oxygen or oxygen-enriched air into a furnace with a conventional burner, channel-type carbon black particles can be produced, and carbon black yields and energetic yields of combustion can be improved. However, it was noted that since the tests were carried out on a pilot scale, properties of the carbon black obtained might differ from those produced in an industrial plant.

Thermal.—Unlike channel and the gas and oil furnace blacks, thermal blacks are produced by cracking hydrocarbons; that is, by separating carbon from the hydrogen and not by the combustion of hydrocarbons. Thermal furnaces are built in a checkerboard brickwork pattern. Two refractory-lined furnaces, or generators, are used. One generator is heated using hydrogen as a fuel, while the other is charged with natural gas, which decomposes to produce thermal black and hydrogen. Hydrogen collected is used as fuel for the generator being heated. Yields of carbon black range from 40% to 50% and are primarily in the large particle sizes. This process has been declining in importance because of its dependence on high-cost natural gas as a feedstock and limited application of the large-sized particles produced by this method.

Channel Black.—Made by the oldest process, channel black is a product of incomplete combustion of natural gas. Small flames are impinged on cool surfaces, or channels, where carbon black is deposited and then scraped off as the channel moves back and forth over a scraper. Properties of channel black are varied by changes in burner tip design, distances from tip to channel, and the amount of air made available for combustion. The process is extraordinarily inefficient chemically. For rubber-reinforcing grades, the yield is only 5%; for high-color blacks of finer particle sizes, the yield shrinks to 1%. Low yields and rising gas prices have spurred the industry to develop other methods to make blacks.

Lampblack.—Lampblacks are manufactured by slowly burning selected oils and tars in a restricted supply of air. These blacks are of large particle size, possess little reinforcing ability in rubber, and are low in jetness and coloring power. They are of value as tinting pigments in certain paints and lacquers. In most applications lampblacks have been replaced by carbon blacks.

Carbon Black Substitutes.—Coal-derived carbon blacks have yet to be produced commercially, but several small companies are marketing carbon black extenders and fillers that are produced from anthracite and bituminous coals. These carbon black substitutes are used in rubber compounding and in the production of carbon paper, ink, paint, and plastics. Extenders (fillers from coal) are being utilized in conjunction with furnace carbon blacks, replacing thermal blacks.

New Technology.—Research into new technologies focused mainly on reclamation of carbon black from scrap tires. In one process, tires would be chemically decomposed by pyrolysis, and oil, steel, and carbon black components would be recovered; it is believed that an average of 5.7 pounds of carbon black can be recovered from each tire. A test-facility is to be set up by Goodyear Tire & Rubber Co. and The Oil Shale Corp. (TOSCO) at Rocky Flats, Colo., in 1976. If the process is successful, Goodyear plans construction of a scaled-up plant during 1977 that would produce about 63 million pounds of carbon black per year. In another process developed by Cities Service Co. and Goodyear, ground-up scrap tires are mixed with feedstock oil and burned in a limited amount of air to produce carbon black.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, the People's Republic of China, Norway, Poland, Turkey, and the U.S.S.R. produce carbon black, but production is not reported, and available information is inadequate to permit formulation of reliable estimates of output levels.

[2] Less than ½ unit.

[3] Includes vegetable black but excludes acetylene and bone black.

Cement

By Jean W. Pressler [1]

Shipments of portland cement including cement imported and distributed by domestic producers from plants in the United States and Puerto Rico in 1975 were 67,776,000 tons, 15% less than in 1974 and the lowest since 1963. This was also 22% below the record shipments of 86.6 million tons in 1973. It was the first time in the past 30 years and only the fourth time in nearly 100 years (1880) that portland cement shipments declined for two or more consecutive years.

In spite of decreased shipments, total mill value was $2.1 billion, compared with that of 1974, reflecting a unit value increase of $4.57 per ton.

In 1975, the cement industry had to contend with soaring fuel costs and the recession. But advantageously, sales and cash flow moved in gear with one another, a basic change since pre-1970. It was easier to put through price increases to offset higher costs, and during 1975 the average price of cement increased 17.2%, in spite of 15% lower shipments. With a projection of the 20-year historical growth rate of 1.4% for portland cement shipments, cement producers will be able to achieve higher operating rates and thus reduce unit costs and increase profit margins. In the next 10 years, undercapacity rather than overcapacity will be a problem because few new plants are scheduled to go onstream in the near future.

Lone Star Industries, Inc.'s Seattle cement plant received the 1975 Clean Air Award from the Washington Lung Association, and its Nazareth, Pa. plant was given the 1975 Environmental Award of the Northampton County Conservation District. Louisville Cement Co.'s Logansport, Ind. plant, with 3,666 days without a lost-time accident, was the leader among Portland Cement Association members competing for the 1975 Safety Contest Awards. An additional 12 plants with more than 1,000 days without a lost-time accident were also mentioned.

According to the National Safety Council, of 41 major industries, the cement industry was in 32d place for average severity of accident rates, but was in first place in the nonmetallic group, with 1,119 days lost from work per million man-hours. For the average injury frequency rate, cement was in 2d place in the surface mining group and 24th place in the 41-major-industry group, with a rate of 10.69 disabling injuries per million man-hours. The average days lost per disabling accident in the cement industry was 105, compared with 57 for all industries combined. The cement industry was divided into two categories: (1) Mills, which had an average accident frequency rate of 10.63 and a severity rate of 975; and (2) quarries, which had 11.13 and 2,357, respectively.

Continuing from yearend 1974, the construction industry, and residential building especially, was severely hit in the 1975 recession by the high cost of money and inflation; this resulted in high unemployment in the industry, and shipments declined in 1975 for the second year in a row. In the last half of the year, the economy started to recover, the construction industry began to follow along, and shipments of cement increased slightly, thus setting the stage for increased production.

Many cement producers were converting their plants to the use of coal, or to its utilization as a backup fuel, principally owing to rising energy costs and natural gas shortages. Increased utilization of preheaters, conversion from wet to dry processing, and exploration, development, and investment activities to establish independent fuel reserves were becoming accepted energy conservation measures.

---

[1] Physical scientist, Division of Nonmetallic Minerals.

Statistical data in some tables are arranged by State or groups of States to form cement districts. A cement district represents either a segment of a State or a group of contiguous States. In several cases it was necessary to group together States that are not contiguous. The States of California, New York, and Pennsylvania were divided to provide additional marketing information. Divisions for these States are as follows:

California, Northern.—Points north and west of the northern borders of San Luis Obispo and Kern Counties and the western borders of Inyo and Mono Counties.

California, Southern.—All other counties in California.

New York, Western.—All counties west of a dividing line following the eastern boundaries of St. Lawrence, Lewis, Oneida, Madison, Chenango, and Broome Counties.

New York, Eastern.—All counties east of the above dividing line.

New York, Metropolitan.—The five counties of New York City (Bronx, Kings, New York, Queens, and Richmond) plus Westchester, Rockland, Suffolk, and Nassau Counties.

Pennsylvania, Eastern.—All counties east of the eastern boundaries of Potter, Clinton, Centre, Huntingdon, and Franklin Counties.

Pennsylvania, Western.—All other counties in Pennsylvania.

[r] Revised.

[1] Excludes Puerto Rico.

[2] Portland and masonry cement only.

[3] Includes imported cement shipped by domestic producers.

[4] Value received, f.o.b. mill, excluding cost of containers.

[5] Quantity shipped plus imports minus exports.

[6] Adjusted to eliminate duplication of imported clinker and cement shipped by domestic cement manufacturers.

DOMESTIC PRODUCTION

During 1975, 1 State agency and 56 companies operated 178 plants in 41 States, and another 2 companies operated 3 plants in Puerto Rico to manufacture 1 or more kinds of hydraulic cement.

PORTLAND CEMENT

Manufacturers in the United States and Puerto Rico produced 64,539,000 tons of clinker and imported 1,207,000 tons of foreign clinker to grind 66,796,000 tons of portland cement. Domestic producers shipped 67,776,000 tons of portland cement, which included 980,000 tons of imported cement. Stocks at mills decreased by 0.5 million tons. An additional 1.3 million tons of portland cement was imported and shipped or used by others not producing cement in the United States and Puerto Rico.

Much capacity was shut down during the year, mostly obsolete or inefficient equipment, especially kilns and mills, that was not replaced. Several major expansion and improvement programs involving new kilns and mills were completed during the year.

The rate of installation of dust collectors in the cement industry remained high during 1975, but was not quite up to 1974, or the record pace of 1973, when dust collectors were the biggest single item installed.

Only three new cement distribution terminals were known to have been built in 1975, but several were enlarged. None is known to have been closed down. At two of the five cement plants shut down completely during the year, the storage and distribution facilities will be used as terminals for other company plants.

Thirty-one companies had multiplant operations ranging in number from 2 to 14 plants. Nevertheless, no single company accounted for more than 6.4% of the total clinker production capacity. The 5 largest producers comprised 25.8% of the clinker production capacity; the 10 largest accounted for 46.5%; and the 20 largest had 72.2% of the total capacity. The 10 largest companies in terms of clinker production capacity were: Ideal Basic Industries, Inc; General Portland, Inc.; National Gypsum Co.; Martin Marietta Cement; Amcord, Inc.; Universal Atlas Div. of United States Steel Corp.; Kaiser Cement & Gypsum Corp.; Marquette Cement Manufacturing Co.; Medusa Cement Co.; and Lone Star Industries, Inc. (including Citadel Cement Corp., a joint venture). The largest individual plant was at Alpena, Mich., operated by Huron Cement Div. of National Gypsum Co.

Production Capacity.—Only one new single-kiln plant with an annual capacity of 550,000 tons was brought into production during the year. An additional 9 new kilns started operating at existing plants, while 41 old kilns were permanently removed from service, leaving a net annual capacity loss of about 2,700 tons per day. Of the 10 new kilns installed, 2 were wet process, 2 were dry process, and 6 were dry process with suspension preheaters.

At yearend 435 kilns were being operated by 52 companies and a State-owned company in South Dakota at 164 plants in 41 States and Puerto Rico, with an estimated 24-hour daily clinker production capacity of 290,000 tons. An average of 47 days of downtime was reported for kiln maintenance and replacing refractory brick. Based on 318 days of operation, the apparent annual clinker production capacity of the industry was 92.3 million tons.

In 1975, the closing of 5 plants and the startup of 1 new plant, coupled with the annual reappraisal of daily clinker production capacity by 25 companies, resulted in a net loss of 2,700 tons of daily clinker capacity. A recapitulation of this net loss follows:

Type of change	Number of kilns	Tons per day
New, added, replacement	+10	+14,014
Abandoned	−41	−11,814
Company reappraisal	--	− 4,906
Net change	−31	− 2,706

At yearend the average annual clinker capacity of each plant in the United States was 570,000 tons, and the average annual clinker capacity of each kiln was 209,000 tons. Average kiln capacity varies widely with the many States and market areas, from 95,000 tons per year in one State to 430,000 tons per year in another. Seven States representing 17% of total U.S. capacity have an average kiln capacity of 350,000 tons per year, and 22 States representing 60% of total U.S. capacity have an average kiln capacity of 270,000 tons per year.

The 20-year historical growth rate of U.S. cement capacity, including Puerto Rico and clinker imports, is 1.4%. Although clinker manufacturing capacity has been increasing at a rate similar to that of domestic cement consumption, clinker imports have been increasing at a much faster rate and may in time support a more rapid U.S. clinker capacity growth rate. It is estimated that through 1985 the clinker-manufacturing-capacity growth rate may approach 2.5%.

During the year 168 clinker-producing plants, including 7 white cement facilities, were in operation. Six of the white cement facilities were adjacent to gray cement plants. Twelve grinding mills operated only on imported, purchased, or interplant transfers of clinker: Four of these produced only masonry cement, one ground both portland and masonry cement, and seven ground portland cement only. Based on the fineness necessary to grind Types I and II cements, and making allowances for downtime required for maintenance, the cement industry in the United States and Puerto Rico had an estimated grinding capacity of 106 million tons of cement annually.

During 1975 clinker was produced by wet-process kilns at 98 plants and by dry-process kilns at 64 plants; 6 plants had both processes in operation. Dry-process kilns with preheaters were becoming increasingly important because of lower fuel consumption.

In the interests of energy conservation and the realization of substantial fuel economies, 23 companies in 28 different plants were utilizing 48 preheater installations in their kiln operations at yearend. Seven Grudex[2] preheaters were operating on 10 kilns at 2 plants, and 7 traveling-grate preheaters were operating at 4 different plants. A steady growth in installation of suspension preheaters continued in 1975. During the year, nine new suspension preheaters were put onstream and ranged in size from 550 to 2,000 tons per day. From 1973 through 1975, the number of suspension preheaters almost doubled. There were 18 suspension preheaters in 1973, 25 in 1974, and 34 in 1975.

New Plant Installations.—Only one new plant was completed in 1975. Late in December the Florida Mining and Materials Corp. started up its new $31 million, 550,000-ton-per-year cement plant near Brooksville, Fla. This was the only all-new cement plant at a new location completed during the year. All mechanical and electrical equipment was supplied by the Polysius Corp. of Atlanta, Ga., including a pneumatic homogenizing system, a 24-foot, four-stage counterflow GEPOL suspension preheater with a 14.5-foot by 229-foot-long dry-process kiln, a 20-foot-diameter separator, a 13- by 32-foot airswept raw ball mill, and an air-lift conveyor system. Other equipment included a Jeffrey 600-horsepower reversible limestone crusher, a Hazemag 45-ton-per-hour crusher, a 280-ton-per-hour Pohlig-Heckel-Bleichert Vereinigte Maschinenfabriken AG (PHB) reclaiming scraper, a Fuller grate cooler, two 2,500-horsepower finish mills, and a Joy (Western Precipitation) glass baghouse.

Plant Closures.—Five plants permanently ceased production of cement and clinker in 1975: Ideal Basic Industries, Inc. (Baton Rouge, La.); Marquette Cement Manufacturing Co. (Milwaukee, Wis.); Universal Atlas Cement Div., United States Steel Corp. (Fairborn, Ohio and Duluth, Minn.); and The National Portland Cement Co. (Brodhead, Pa.).

Plant Improvements and Expansions.—During 1975, three plants replaced or supplemented existing plants at the same location. They are Ash Grove Portland Cement Co., Louisville. Nebr.; Citadel Cement Corp., Roanoke, Va.; and Missouri Portland Cement Co., Joppa, Ill.[3]

Seven major expansion and improvement programs involving new kilns or kilns and mills were completed in 1975. They were Kaiser Cement & Gypsum Corp., Longhorn Div., San Antonio, Tex.; Martin Marietta Corp., Southern Div., Roberta, Ala.; Maule Industries, Inc., Pennsuco, Fla; Missouri Portland Cement Co., Joppa, Ill.; The Monarch Cement Co., Humboldt, Kans.; National Gypsum Co., Huron Cement Div., Alpena, Mich.; Northwestern States Portland Cement Co., Fort Dodge, Iowa; and The Whitehall Cement Manufacturing Co., Cementon, Pa.

The Ash Grove Portland Cement Co. in 1975 completed the second phase of a three-phase program at Louisville, Nebr. Phase II included a new dry-process kiln with a traveling-grate preheater and a cooler. This kiln replaced five old wet-process kilns. Also included were four 2,170-ton kiln feed silos, a coal mill, a double-chamber precipitator for the kiln, and a baghouse collector for the cooler.

Citadel Cement Corp., a joint venture of Lone Star Industries, Inc., and Canada Cement Lafarge Ltd., completed the $35 million expansion of its plant near Roanoke, Va. New equipment included a grate preheater kiln, a 22-foot-diameter pelletizing pan, three electrostatic precipitators, a 10- by 41-foot clinker cooler, two raw roller mills, two 13- by 34-½-foot finish mills, a homogenizing system, and a computer system. Site preparation started for Citadel's new 750,000-ton-per-year $50 million cement plant at Demopolis, Ala., which is now scheduled for startup in mid-1976. This plant will replace the existing plant at the site being operated by Citadel under lease from Lone Star Industries.

---

[2] Grudex is a special type of preheater developed by Coplay Cement Manufacturing Co. and fabricated by Kennedy Van Saun Corp.

[3] Trauffer, W. E. Outlook & Review 1975–1976: Portland Cement—Costs, Prices Up, Revenue Static in 1975; Increased Shipments Expected in 1976. Pit & Quarry, v. 68, No. 7, January 1976, pp. 55–65.

Kaiser Cement & Gypsum Corp. completed an expansion program at its Longhorn Div. plant near San Antonio, Tex. The capacity of this plant was nearly doubled. New equipment included a dry-process kiln with a suspension preheater and grate cooler, a raw roller mill, and a modular glass baghouse for both the kiln and cooler. More than $1 million went into air pollution control equipment. The kiln and mill are controlled by electronic instrumentation. Early in 1975 Kaiser announced the completion of a new cement distribution terminal in Phoenix to serve the Arizona market. A 1,600-ton silo was added to the terminal on Kauai, Hawaii.

A major expansion and renovation program at the Roberta, Ala., plant of Martin Marietta Corp. included kiln and cooler baghouses, expanded feed ends and chain systems in the two cement kilns, the installation of a raw mill and related facilities, and the conversion of raw mills to finish grinding.

Maule Industries, Inc., completed the first of two stages of an expansion program at its Pennsuco, Fla., plant. This increased its capacity from 430,000 tons per year to about 1,200,000 tons per year.

Missouri Portland Cement Co. completed a $21 million expansion of its Joppa, Ill., cement plant, which doubled its capacity to 750,000 tons per year.

The Monarch Cement Co. completed a $13 million expansion, modernization, and pollution control program begun in 1971 at its Humboldt, Kans., plant. This is one of the few plants in the United States with 100% of its production from preheater kilns.

At the Alpena, Mich., plant of the Huron Cement Div., National Gypsum Co., a major modernization and expansion program was completed. A unique feature was the use of two waste-heat boilers, which transform waste heat from the kiln into power through the use of steam generators.

Northwestern States Portland Cement Co. completed a major expansion and improvement program at its Mason City, Iowa, plant.

The Whitehall Cement Manufacturing Co. completed the expansion of its plant at Cementon, Pa. Operation of the kiln and mill is controlled by the existing on-line process control computer.

The swing to coal firing of kilns was evident from the fact that 20 Raymond coal mills were shipped to U.S. plants in 1975, and 26 were scheduled for 1976 installation.

New plant and important plant expansion and improvement programs reported in 1975 involved a total expenditure of at least $313 million, well ahead of similar estimates in any recent year.

Alpha Portland Cement Co. reportedly completed another phase of a 4-year modernization and expansion program at its Birmingham, Ala., plant, which included a new quarry.

Amcord, Inc., completed the conversion from natural gas to coal firing at the three plants of its western subsidiaries—Phoenix Div. at Clarkdale, Ariz., and the two Riverside Div. plants at Oro Grande and Riverside, Calif.

Coplay Cement Manufacturing Co. was reported to have purchased the cement plant at Craigsville, Va., which was shut down in 1968 by Lehigh Portland Cement Co. This plant was to be rehabilitated and used to process clinker from Coplay's Pennsylvania plants.

Cyprus Hawaiian Cement Corp., owned by Cyprus Mines Corp., completed the final stage of an expansion program which increased capacity to 470,000 tons per year.

The Dundee, Mich., plant of Dundee Cement Co. commissioned two gravel-bed filter systems to clean the clinker coolers' exhaust air of particulates. The filter systems were controlled by programmable controllers.

At the San Andreas, Calif., plant of the Calaveras Cement Div. of The Flintkote Co., a $4 million improvement program was completed. Engineering was underway for coal-burning systems to be installed at both the Division's plants. At the Diamond-Kosmos Div. plant at Middlebranch, Ohio, three kilns were shut down, and the fourth operated under an Environmental Protection Agency variance that was to expire July 1, 1976.

Ideal Cement Co. reportedly has well underway the modernization program at the Knoxville, Tenn., plant of its Volunteer Div. Production of cement at Ideal's Baton Rouge, La., plant was terminated permanently on March 31, 1975, but the site will continue as a distribution terminal. Originally built as an aluminum-sintering plant during World War II, it was purchased by Ideal in 1950 and converted to portland cement manufacture in 1951. Ideal was planning conversion of all plants using either natural gas or oil, to coal as the primary fuel. Stansbury Coal Co., a joint venture of Ideal, will reopen a mine near Rock Springs, Wyo., to produce coal for the company's plants at Boettcher, Colo., Superior, Nebr., Devil's Slide, Utah, Trident, Mont., and Seattle, Wash.

At the Bath, Pa., plant of Keystone Portland Cement Co., two baghouse collectors were installed on clinker coolers. Conversion to the use of coal as a primary fuel was also accomplished.

Louisville Cement Co. announced that it was awarding a contract to design and build a suspension preheater kiln and raw roller mill system at its Speed, Ind., plant at a cost of about $25 million.

The Marquette Co. is reported to have well underway at its Hagerstown, Md., plant a $7 million improvement program. Marquette permanently closed down its 230,000-ton-per-year cement plant in Milwaukee, Wis. This will be used only as a distribution center.

At the Martinsburg, W. Va., plant of Martin Marietta Corp. the installation of three clinker cooler baghouses was completed. Installation of a clinker cooler baghouse was completed at the Thomaston, Maine plant and engineering was in progress to convert this plant from wet to semidry. At the Davenport, Iowa, plant a major improvement and renovation program at a cost of some $10 million was completed. Construction was nearing completion on coal handling, storage, and grinding facilities at the Tulsa, Okla., plant.

National Cement Co., Inc., which was acquired by the Société des Ciments Vicat of Grenoble, France, from the Mead Corp. in mid-1974 was reportedly making good progress on the modernization and expansion program then announced for its Ragland, Ala., plant. An SF process clinker flash-calcining system, the first in this country, with a four-stage suspension preheater, was ordered.

Allentown Portland Cement Co., a division of National Gypsum Co., reportedly completed the expansion of its Evansville, Pa., plant.

The Oregon Portland Cement Co. was installing an electrostatic precipitator at its Lime, Oreg., plant.

The Cement Div. of Penn-Dixie Industries, Inc., was installing two electrostatic precipitators at its plants at Kingsport and Richard City, Tenn., both for completion in 1976.

Puerto Rican Cement Co., Inc., with plants at Ponce and San Juan, P.R., late in 1974 was granted a price increase and a Puerto Rican Government loan of about $15 million to help finance an air pollution control program now underway at these plants.

San Juan Cement Co., Inc., put into operation a $5 million emission control program which included increasing the capacity of existing baghouses and installing bag dust collectors throughout the plant.

The South Dakota Cement Plant, Rapid City, S. Dak., was conducting a major expansion program.

The Universal Atlas Cement Div. of United States Steel Corp. was installing a new 600,000-ton-per-year dry-process cement operation at Leeds, Ala. Extensive modernization and expansion at its Buffington, Ind., plant was completed in mid-1975. Universal Atlas announced that it would close down permanently, at the end of 1975, its plants at Fairborn, Ohio, and Duluth, Minn.

Table 2.—Portland cement shipped by producers in the United States, by district[1] [2]

(Thousand short tons and thousand dollars)

District	1974			1975		
	Quantity	Value	Average per ton	Quantity	Value	Average per ton

Total or average	96	62	6	164	435	290.0	47	92,264	64,539	70.0

[1] Includes Puerto Rico.

[2] Includes white cement producing facilities and the new Florida Mining and Materials Corp. (Brookville, Fla.) plant. Excludes five plants that permanently ceased clinker operations during 1975. Plants not active Dec. 31, 1975 were Ideal Basic Industries, Inc. (Baton Rouge, La.), Marquette Cement Manufacturing Co. (Milwaukee, Wis.), Universal Atlas Cement Div., United States Steel Corp. (Fairborn, Ohio, and Duluth, Minn.), and The National Portland Cement Co. (Brodhead, Pa.).

[3] Calculated on individual company data: 365 days, minus average days for maintenance, times the reported 24-hour capacity.

[4] Includes production reported for plants which added or shut down kilns during the year.

Table 5.—Daily clinker capacity, December 31[1][2]

Short tons per 24-hour period	Number		Total capacity (short tons)	Percent of total capacity
	Plants	Kilns[3]		
1974:				
Less than 600	4	7	2,337	0.8
600 to 1,150	45	87	39,723	13.6
1,150 to 1,700	51	130	70,711	24,2
1,700 to 2,300	35	103	68,166	23.3

Siliceous:		
Sand	2,235	1,813
Sandstone and quartz	846	582
Ferrous: Iron ore, pyrites, millscale, and other iron-bearing material	800	772
Other:		
Gypsum and anhydrite	4,172	3,527
Blast furnace slag	805	465
Fly ash	322	180
Other, n.e.c	6	2
Total	137,227	114,944

[1] Includes Puerto Rico.

MASONRY CEMENT

Shipments of masonry cement including foreign imports were 2.9 million tons, 15% below the 1974 level and down 29% from the record 4.1 million tons shipped in 1973. The unit value increased $5.97 per ton to $38.90, and the total value of shipments was $113 million. By yearend 115 plants were manufacturing masonry cement. Five plants produced masonry cement exclusively: Cheney Lime & Cement Co., Allgood, Ala.; Martin Marietta Cement. North Birmingham, Ala.; M. J. Grove Lime Div. of Th Flintkote Co., Frederick, Md.; G. & W. H Corson, Inc., Plymouth Meeting, Pa.; an Riverton Corp., Riverton, Va. In som States, masonry cement was not produce because the majority of the masons pr ferred to purchase portland cement an add clay or lime for plasticity on the jol

[2] Includes imported cement.

[3] Less than 500 short tons.

[4] Includes 2,558 tons produced from clinker, 844 tons produced from cement (1974); 2,185 tons produced from clinker, 739 tons produced from cement (1975).

[5] Data do not add to total shown because of independent rounding.

ALUMINOUS CEMENT

Aluminous cement, also known as calcium aluminate cement, high-alumina cement, and "Ciment Fondu," is a nonportland hydraulic cement produced at three plants in the United States. Universal Atlas Cement Div., United States Steel Corp., manufactured calcium aluminate clinker and cement at a facility adjacent to its gray portland cement plant in Buffington, Ind. The Aluminum Co. of America operated kilns and grinding facilities to produce aluminous cement at Bauxite, Ark. Lone Star Lafarge Co. (a joint venture between Lone Star Industries, Inc. and the Lafarge Group) ground calcium aluminate cement from imported clinker at Norfolk, Va.

SLAG CEMENT

Slag cement has not been manufactured in the United States since 1972. Some shipments of slag cement were made from stocks at mills during 1973, but no slag cement shipments were made in 1974 and 1975. The last plants to produce slag cement—Martin Marietta Cement at North Birmingham, Ala., and Cheney Lime & Cement Co. at Allgood, Ala.—experienced considerable difficulty obtaining granulated slag from steel mills and were unable to purchase an adequate supply.

ENERGY

The cement industry has been more seriously affected than most other industries by the severe shortages of natural gas and oil, as it is one of the Nation's most energy-intensive industries, the sixth largest consumer, and has by far the highest energy costs. Expressed as a percentage of the total cost of materials, energy amounts to 35% to 40% of the total manufacturing cost. As a result, the conversion of plants to coal firing is going ahead rapidly, and several companies are opening their own coal mines or obtaining preferential rights to coal as a backup fuel by investment or long-term contracts. In 1975 the industry also made substantial strides in increasing the efficiency of its plants by the installation of energy- and fuel-saving kilns, mills, and other process equipment.

Fossil fuel energy consumed by the cement industry to produce 1 ton of clinker ranged from 3.5 million Btu to 11.8 million Btu and averaged 6.05 million Btu. Very little improvement, if any, was made in 1975 compared with 1974. An additional 1.52 million Btu in electrical energy (142.5 kilowatt-hours per ton was required in the production of 1 ton of portland cement, mostly for grinding. Based on information from the Energy Research and Development Administration, the Federal Power Commission calculated an average heat rate of 10,660 Btu per net kilowatt-hour from national average heat rates for fossil-fueled steam-electric plants. So the total energy used to produce 1 ton of portland cement in 1975 averaged 7.57 million Btu. The average fuel used in producing 1 ton of clinker at an inefficient wet-process plant was almost four times that in an efficient dry-process plant.

This illustrates the fuel conservation improvement potential of the cement industry. With the cost of fuel running 35% to 40% of the total cost of clinker production, and the great disparity between fuel consumption in 435 kilns operating in the United States and Puerto Rico in 1975, there is a long way to go before it can be properly said that the cement industry is energy efficient, in addition to being energy intensive.

Amcord, Inc., in 1975 became the first major western cement producer to convert to coal as its prime energy source by purchasing a coal mining operation in northern New Mexico for its Clarkdale, Ariz. plant.

In the three cement plants of the California Portland Cement Co., coal can now be burned. Much of the production of a wholly owned subsidiary, the Soldier Creek Coal Co. in Price, Utah, was being shipped to the company's three cement plants.

The Flintkote Co. had plans well underway for the installation of coal handling, storage, and burning facilities at its two California plants. Total cost will be $4 million.

The conversion of General Portland, Inc.'s plants to alternate fuel has been very costly. By the end of 1975 the company had four cement plants operating with coal as primary fuel, and three others had coal-burning facilities as alternate systems.

Ideal Basic Industries, Inc. at a cost of $9 million had coal-burning facilities operational at 6 of its plants, and by 1977 will have only 1 plant out of 13 wholly dependent on oil or gas.

Kaiser Cement & Gypsum Corp.'s San Antonio plant was being equipped to burn coal as a primary fuel at a cost of $2 million. Programs were also initiated to convert the company's four other cement plants to coal use, with a total estimated cost of $15 million.

Marquette Co.'s subsidiary, Southern Energy Resources Co., began coal mining operations in southern Tennessee, principally to supply coal for its plants in Tennessee and Georgia.

Medusa Cement Co. finished installing a new dry-process preheater kiln in its Georgia plant. It now uses 44% less energy per ton than in 1974. New chain sections in its kilns at Wampum and York, Pa., now compare favorably with dry-process plants without preheaters.

Missouri Portland Cement Co. claimed substantial fuel savings from maximum recycling of kiln heat previously wasted. Expenditures to accomplish this were more than justified.

Oregon Portland Cement Co. started converting its Lake Oswego plant to coal. It will be ready in early 1976 and will enable the plant to use either natural gas, Bunker C fuel oil, or coal.

Southwestern Portland Cement Co. installed facilities for the use of petroleum coke at its El Paso plant. Other plants already had backup facilities for burning coal. Of energy interest, its Victorville plant claimed equal costs for coal, gas, and fuel oil. At its Fairborn plant, substantial savings resulted from utilization of waste gas to preheat incoming feed.

Table 9.—Clinker produced in the United States, by kind of fuel [1]

Year and fuel	Clinker produced			Fuel consumed

[1] Includes grinding plants and white cement facilities.
[2] Includes Puerto Rico.
[3] Includes data for grinding plants, eight in 1974; seven in 1975.
[4] Data do not add to total shown because of independent rounding.

TRANSPORTATION

Cement was transported from manufacturing plants in bulk or in containers by truck, rail, or waterway. Of the 67,183,000 tons of portland cement shipped from plants in the United States, 51,605,000 tons was sent directly to customers from producing plants and 15,578,000 tons was transferred to distribution facilities strategically located in principal market areas for customer delivery by short-haul truckloads. Although trucks were used to haul 86% of the portland cement to ultimate customers, they accounted for only 5% of the total cement transferred from plants to terminals. Manufacturers continued to use the railroads and waterways almost equally as the principal means of supplying distribution centers—7,222,000 tons by rail and 7,502,000 tons by water.

In the latter part of 1975 over 400 vessels laden with cement were reported waiting to discharge their cargo in the port of Apapa, Nigeria. Some efforts were being made to control the number of vessels charted, but the worst port congestion in the world had been created. Indications were that the vessels would have to wait up to 500 days to complete discharge, with demurrage rates a critical factor. Cement fixtures to Apapa were still being reported during this time—for example, Poland to Nigeria for 10,000 tons was fixed at $19.00 per ton, with a demurrage rate of $3,300 per day, after expiry of the normal discharge time allowed at 1,000 tons per day. A few vessels were being fixed on time charter at rates of $4,000 per day for 15,000-ton vessels.

The freight situation in the Arabian Gulf seemed under control, handling considerably more volume with minimum delays.[4]

W Withheld to avoid disclosing individual company confidential data; included with "Foreign countries."

[1] Includes cement produced from imported clinker and imported cement shipped by domestic producers, Canadian cement manufacturers, and other importers. Includes Puerto Rico.

[2] Excludes cement (1974—440; 1975—384) used in the manufacture of prepared masonry cement.

[3] Has no cement-producing plants.

[4] Less than 500 short tons.

[5] Direct shipments by producers to foreign countries and U.S. possessions and territories; includes States indicated by symbol W.

[6] Includes cement produced from imported clinker by domestic producers (1974—1,904; 1975—1,240).

[7] Imported cement distributed by domestic producers, Canadian cement manufacturers, and other importers. Origin of imports withheld to avoid disclosing individual company confidential data.

Total or average	79,482	2,107,906	26.52	[4] 67,776	[4] 2,107,020	31.09

[1] Includes Puerto Rico.
[2] Mill value is the actual value of sales to customers, f.o.b. plant, less all discounts and allowances, less all freight charges to customer, less all freight charges from producing plant to distribution terminal if any, less total cost of operating terminal if any, less cost of paper bags and pallets.
[3] Includes waterproof cement (1974–75), and low-heat (Type IV) and regulated fast setting (1975).
[4] Data do not add to totals shown because of independent rounding.

CONSUMPTION AND USES

Shipments of cement into various States are considered to be an index of consumption. Portland cement consumption decreased 15% below that of 1974. Consumption shown in table 13 decreased in all but five States and shipping districts. The largest decrease was in Florida, with 1,794,000 tons; followed by Georgia, 685,000 tons; Michigan, 683,000 tons; Virginia, 574,000 tons; and metropolitan New York, 559,000 tons. The largest increase was in Wyoming with 72,000 tons, followed by North Dakota with 50,000 tons, and Alaska with 45,000 tons.

Producers of ready-mix concrete were the primary customers for portland cement, receiving 64.2% of total shipments. Concrete product manufacturers used 13.8% of the cement to make concrete blocks, concrete pipes, precast-prestressed concrete, and other concrete products. Direct shipments to highway contractors amounted to 8.1% of the total cement consumed during the year. Building materials dealers received 7.9% of the shipments, other contractors received 3.9%, Federal, State, and other government agencies purchased 0.5%, and 1.6% went for miscellaneous uses.

New housing unit starts, public and private, in 1975 were 13% below those in 1974; however, because of inflation, the value of new construction put in place was down only 0.5%. Private construction value decreased 7% below that of 1974, while value of public construction increased 6%. Residential construction value was down 16% for single unit and multiunit housing combined. Value of total private-nonresidential building was down 11%. Farm construction (other than residential), was off 25%; office buildings, 19%; other commercial buildings, 20%; telephone and telegraph buildings, 14%; and educational buildings, 13%. Private public utilities construction value was up 8%, led by petroleum pipelines, 210%; railroads, 18%; and gas, 16%. Total value of new public construction advanced 6%, with the following significant increases: Industrial, 20%; military facilities, 18%; sewer systems, 17%; conservation and development, 15%; hospitals, 10%; and other public buildings, 9%.

PRICES

The average mill value[5] of portland cement (all types) was $31.09 per ton in 1975, an increase of $4.57 per ton. Mill values for cement districts ranged from a low of $26.27 in New York and Maine to highs of $36.33 in Florida, $43.73 in Hawaii, and $38.54 in Puerto Rico.

---

[5] Mill value is the actual value of sales to customers f.o.b. plant, less all discounts and allowances, less all freight charges to customer, less all freight charges from producing plant to distribution terminal if any, less total cost of operating terminal if any, less cost of paper bags and pallets.

The Bureau of Mines collects mill value for cement shipments but does not canvass cement prices. However, according to Engineering News-Record, December bulk-mill prices ranged from $27 in Northampton, Pa., to $72 in Anchorage, Alaska. Bagged cement prices were $6 to $8 per ton higher than bulk prices. All prices were subject to cash discounts. Base prices for portland cement in carload lots f.o.b. were reported monthly in Engineering News-Record for 20 cities in the United States. The December 1975 average for bulk cement was $37.50 per ton, compared with $33.45 in December 1974. In the 20-city survey, bulk prices ranged from a low of $33.65 per ton in Dallas, Tex., to highs of $40.30 per ton in Minneapolis, Minn., and $44.30 per ton in San Francisco, Calif. Masonry cement averaged $55.71 per ton in December 1975 and ranged from $46.57 per ton in Pittsburgh, Pa., to $74.29 per ton in Kansas City, Kans.

On May 12 and July 1, 1975, the Puerto Rican Department of Consumer Affairs approved increases in the price of a bag of cement at the producer's level in the amount of 15.41 and 16.01 cents, respectively. The price of bagged cement for the years ended December 31, 1975, 1974, and 1973 was $2.6884, $2.2390, and $1.6000, respectively; for bulk cement the price was $2.3884, $1.9790, and $1.6000 per bag equivalent. During 1975, overall construction continued to lag and cement consumption declined, reflecting the Island's economic recession. The private housing sector in particular was seriously depressed, being affected by tight money, high interest rates, and a large housing inventory. Export sales totaled 2.4 million bags in 1975, compared with 4.8 million bags in 1974.

Continued increases in fuel prices and inflation rates, much higher (18%) than in the United States, were responsible for substantial increases in world cement prices. A sampling of increases above 1974 cement prices for selected countries follows: The United Kingdom, 40%; Norway, 30%; Australia, 22%; the Netherlands, 19%; France, 17%; Luxembourg and Finland, 15%. While the price was unchanged in Greece and Turkey, it was probably State-controlled.

Table 16.—Average mill value in bulk, of cement in the United States [1]

(Per short ton)

Year	Portland cement	Prepared masonry cement [2]	All classes of cement
1971	$18.74	$25.28	$19.01
1972	20.31	26.52	20.59
1973	21.88	29.43	22.23
1974	26.52	32.93	26.79
1975	31.09	38.90	31.41

[1] Includes Puerto Rico.

[2] Masonry cement made at cement plants only.

FOREIGN TRADE

Hydraulic cement exported from the United States increased 70% in quantity, and the value almost doubled. In relative importance, cement exports amounted to less than 0.7% of the quantity and 1.3% of the value of total domestic shipments. Six countries—Canada, Mexico, the Dominican Republic, Leeward and Windward Islands, Venezuela, and the Netherlands Antilles—received 94% of the 494,100 tons of cement valued at $28,409,000 exported to over 80 countries.

Portland cement and clinker imported from 17 countries for consumption in the United States and Puerto Rico decreased 35% in quantity and 31% in value compared with 1974, and was 45% below the record 1973 imports. Nevertheless, despite a 15% decrease in domestic production caused by a continuation of the general economic recession, imports comprised 5% of total domestic cement shipments. Nearly 50% of the imports entered at customs districts in Florida (23.0%) and New York (25.9%).

Canada continued to be the leading exporter to the United States, supplying 49% of the imported cement and clinker, followed by Norway with 10%; Bahamas, 9%; and France and Spain, 8% each.

Clinker comprised 33% of the total imports in 1975, compared with 32% in 1974, 41% in 1973, and 34% in 1972. Four plants operated exclusively on imported clinker—one each in Michigan, Florida, Virginia, and Wisconsin. An additional 12 plants supplemented cement production by grinding imported clinker.

While imports comprised 5% of domestic shipments, total imports of 3.7 million tons exceeded the quantity of cement manufactured in each individual producing State with the exception of five States—California, Texas, Pennsylvania, Michigan, and Missouri.

The rate of duty on white, nonstaining portland cement was 1.0 cent per hundredweight, including the weight of container; other hydraulic cement and clinker were duty free, as granted in the final stage of the Kennedy round of trade negotiations under the General Agreement on Tariffs and Trade. However, the statutory import duty from countries that do not have most-favored-nation status was 8 cents per hundredweight for white, nonstaining portland cement and 6 cents per hundredweight for other hydraulic cement and clinker.

World trade in cement and clinker was about 30 million tons, compared with 766 million tons of total world production.

(1) Less than ½ unit.

WORLD REVIEW

In 1975, about 1,700 clinker-producing cement plants in 140 countries were operating with an estimated total annual capacity of over 1 billion tons. In addition, more than 3,000 very small plants were reportedly operating in many communes and municipalities in the People's Republic of China, accounting for more than 50% of that country's estimated 30-million-ton capacity. Many new plants, plant expansions, and plant modernizations were under construction or in various stages of planning and financing throughout the world.

Recessions, fuel crises, inflated costs, and reduced product demand characterized most of the world's cement community in 1975. The several indicated bright spots on the international scene were those principally associated with oil-producing nations.

Special situations occurred: Some 250 cement-carrying vessels laid at anchor off Nigeria, nationalization of the cement industry occurred in Portugal, the first ship through the Suez Canal carried bagged cement, and an appreciable increase took place in attempted "deals" involving the sale and movement of large cement tonnages.

The year 1975 was a volatile one for cement, and on the whole it proved to be a difficult year for major countries from the point of view of usage and viability. However, a number of developing nations, particularly in the Near and Middle East, established expansion programs, the net result of which will surely change existing patterns of demand and supply.[6]

A construction slump in 19 European countries belonging to the European Cement Association (CEMBUREAU) [7] was responsible for a 4.4% decrease in cement production in 1975, the second decline in as many years and the first back-to-back decrease since World War II. Many kilns and some plants were taken out of production because of the depressed market. Nevertheless, six new plants with a combined annual capacity of 5.9 million tons started operation in member countries. An additional 15 new kilns went into production in existing plants with a combined additional annual capacity of 7.8 million tons. Ten kilns in new plants and 17 new kilns in plant expansions were under construction that will increase annual clinker production capacity by 19.0 million tons when completed in 1976 and 1977.

Cement price increases varied considerably in member countries, and average cement prices rose 25% following continued increases in fuel and power costs combined with the inflationary trend of all manufacturing cost items.

The combined output of the 19 member countries of CEMBUREAU amounted to 210 million short tons in 1975 as against 220 million tons in 1974, or a decrease of 4.4%. Comparable figures also indicated that apparent consumption decreased 5.7%. In 1975, CEMBUREAU per-capita cement consumption ranged from 249 kilograms (549 pounds) in Turkey to 913 kilograms (2,013 pounds) in Austria, and averaged 475 kilograms (1,047 pounds). Centrally planned economy countries, including the U.S.S.R., produced 210 million tons in 1975, an increase of 7.4% compared with 1974 output.

World production of cement in 1975 was estimated at 766 million tons, compared with 776 million tons in 1974. The five largest cement-producing countries in 1975 were the U.S.S.R., 134.5 million tons; Japan, 72.2 million tons; the United States, 69.7 million tons; Italy, 37.7 million tons; and West Germany, 36.9 million tons.

Western Europe (European Economic Community) maintained its leading position in the world cement industry by producing 210 million tons of cement in 1975, or 27.4% of the world total. Eastern Europe (including the U.S.S.R.) produced 25.7% of the world total; Asia, 25.0%; North and South America, 17.7%; Africa, 3.3%; and Oceania, 0.9%.

In the 1975 annual report of the Holderbank[8] group, represented by subsidiaries and affiliated companies in 17 countries, reduced cement consumption was reported in 13 countries, including Cyprus (down 45%), Switzerland (down 26%), Lebanon

(down 16%), and the United States (down 16%). This reduction was only partially offset by gains in the other four countries: Philippines, 24%; Brazil, 11%; Mexico, 10%; and Costa Rica, 9%. This resulted in an overall reduction of 18 million short tons, or 7.8%.

Polysius, A.G.[9] noted in its 1975 annual report the major shifts in its construction market. In the previous 10 years, the European market provided about 50% of their order intake; for 1975 it comprised only 12%. This was due to the continued shrinkage in the housing construction market in Europe. In the previous 10 years, Asia and Africa had 29% and 7% of their contracts, but for 1975, this increased to 55% and 27%, respectively. This was because of the lower growth rates for the highly industrialized countries, whereas in the developing countries, there was a strong and increasing demand for cement. Additionally, it is the Organization of Petroleum Exporting Countries (OPEC) nations with their increased foreign exchange income that can proceed rapidly toward industrial development. In the near future, their present high level of cement imports will be reduced by production from their new facilities.

Afghanistan.—The Ghori and Jabal Siraj cement plants produced a total of 154,000 tons per year, of which 40% was exported to the U.S.S.R. and Iran. Capacity of the Ghori plant was to be expanded from 130,000 to 330,000 tons per year. Construction of two additional plants at Herat and Kandahar was being planned.[10]

Algeria.—At least three major cement plant construction programs were underway through contracts signed by Société National Materiaux de Construction (SNMC), Algeria's state corporation for public construction. At Zahana, 21 miles southeast of Oran, Société Fives-Cail Babcock was building a 1.2 million-short-ton-per-year dry facility, which was an extension of the present plant. This will be one of the world's most modern, with an 18- by 275-foot rotary kiln, a four-stage preheater with cyclones, a 130-ton-per-hour hammer mill, and a 165-ton-per-hour rod mill for the clinker, and is planned to be onstream in 1977.

A new, fully integrated, 1 million-ton-per-year plant at El Asnam, about 150 miles from Algiers, was being constructed for SNMC by Kawasaki Heavy Industries, Ltd., and Marubeni Corp. of Tokyo. Daily production was to be 3,300 tons of portland cement and sulfuric-acid-resistant cement. Suspension preheating, fully automated operation at all stages, and computerized process control were features of the plant design. Operation was scheduled to begin by late 1978 or early 1979.

SNMC has also announced a 550,000-ton-per-year cement plant at Saida, to be built by Kawasaki Heavy Industries, Ltd. This installation is scheduled to be completed by late 1977 and in full operation by 1978. Contracts have also been awarded by SNMC for plants to be built at Constantine and Beni Saf.

SNMC's stated objective for the Algerian cement industry is to raise production to a 10.5-million-ton-per-year level by 1980.[11]

Australia.—Adelaide Brighton Cement Ltd. was doubling the capacity of its Port Adelaide, South Australia, plant, with a 550,000-ton-per-year, 50- by 220-foot, four-stage suspension preheater kiln, a Loesche roller mill, and electrostatic precipitators. The plant was expected to start operations in 1976. Blue Circle Southern Cement Ltd. was seeking tenders for an 830,000-ton-per-year expansion of its plant at Berrima, New South Wales.[12]

Belgium.—Belgian cement consumption in 1975 amounted to 6.4 million tons, down 3.4% from 1974, and because of its 12.4% inflation for the year, suffered a 27% reduction in its export sales of cement and clinker.

Cimenteries CBR and ENCI-Belgique have completely computer-automated their new, 3,500-ton-per-day dry-process plant at Lixhe.[13]

Brazil.—Brazil's cement consumption rose in 1975 by about 11% to some 18.4 million tons, and the cement price was increased by 35%, proportional to the inflation.

The new Pedro Leopoldo plant of Cimento Nacional de Minas S.A., with a capacity of 1.1 million tons per year, came onstream. This is the largest single cement-producing facility in Brazil, and is linked to the industrial triangle market area of São Paulo-Rio de Janeiro-Belo Horizonte by a rail distribution system.

Page 21 of work cited in footnote 8.

Cimento Tupi started up a new plant in late 1975. Major equipment items included a 15- by 220-foot rotary kiln with a four-stage preheater, a 14- by 23-foot raw mill, a 12- by 37-foot finish mill, a clinker cooler, and blending equipment.

Cimento Santa Rita S.A., in São Paulo, was installing a 2,200-ton-per-day Allis-Chalmers suspension preheater with a 16- by 230-foot rotary kiln, a 190-ton-per-hour type MPS-3450 roller mill, and a 16- by 46-foot finish-grinding Compeb mill powered with a 6,000-horsepower drive—one of the largest of its type.

Cia. de Materials Sulfurosos' new 2,400-ton-per-day production line at its Montes Claros plant included an 800-ton-per-day EV crusher, a 16- by 22-foot Unidan mill for raw material grinding, a 17- by 263-foot kiln with twin four-stage suspension preheaters and planetary cooler, a 16- by 41-foot finish mill, and electrostatic filters.

At the Sobral, Ceara, plant of Cia. Cearense de Cimento Portland, S.A., a 1,100-ton-per-day expansion project involved a 14- by 224-foot kiln with a suspension preheater and a 14- by 23-foot raw mill with a 2,200-horsepower drive.[14]

Canada.—Canada's cement consumption was 9.8 million tons in 1975, an 8% decrease from 1974. Regional cement consumption reflected construction activity. Quebec consumption rose 1%, while Ontario consumption fell 11%.

Canada Cement Lafarge Ltd. was doubling capacity to 500,000 tons per year at its Brookfield, Nova Scotia, cement plant with a $24 million expansion. It was scheduled for completion in 1977. F. L. Smidth & Co. was supplying an 820-ton-per-day kiln and a 4,500-horsepower finish mill.

Ocean Cement Ltd. was planning a 1.1-million-ton-per-year plant at a cost of $90 million at Tilbury Island, British Columbia; the plant was scheduled to go onstream in 1978. Polysius will supply its DOPOL rotary kiln plant and a planetary cooler with an output of 3,500 tons per day, and a roller mill with a throughput capacity of 270 tons per hour. This is reportedly the largest clinker-producing plant with preheater kiln and roller mill in North America.

Scheduled for completion in 1976, St. Marys Cement Ltd. was doubling output capacity at its plant in St. Mary, Ontario, with a $30 million expansion project. A 500,000-ton-per-year, 15- by 325-foot rotary kiln with a four-stage suspension preheater will be installed.

Lake Ontario Cement Ltd.'s $15 million expansion program was completed in 1975. Doubling the plant's capacity, an 850,000-ton-per-year kiln with a four-stage preheater was installed.[15]

Chile.—In 1975, Chile was nearly self-sufficient in cement. The additional production of Chile's fourth cement plant, Industria Nacional del Cemento S.A., which opened in early 1975, eliminated the need for imports during 1975 and allowed modest quantities of exports to other Latin American countries. The Government of Chile announced it would return ownership of the industry to the private sector.[16]

China, People's Republic of.—The Chinese cement industry is becoming a world factor. Current output of 20 to 30 million tons yearly is catching up with that of the leading Western European countries and is continuing to rise. There are probably 50 or more plants capable of producing between 100,000 and 1 million tons yearly. There are over 3,000 so-called small cement plants in two sizes—ranging from 3,000 to 10,000 tons per year, and from 10,000 to 50,000 tons per year. These small plants have been very important in rural areas for local construction projects. The cement shipped to Hong Kong has been of reasonably good quality.[17]

Colombia.—For Colombia, 1975 was rather a poor year for building activity. Cement consumption was 3.1 million tons, a 12.9% decrease compared with 1974 use.

Polysius reported that the commissioning of the new slag and clinker grinding plant of Cementos Boyacá S.A. in Bogotá was further postponed because of transportation difficulties. It is now expected to come onstream in early 1976. Equipment included a 14- by 44-foot, 4,330-horsepower cement mill, a 25-foot-diameter air separator, and an 11- by 17-foot rapid dryer. This $7 million expansion program will raise the plant capacity from 360,000 to 520,000 tons per year.

[16] U.S. Embassy, Santiago, Chile. State Department Airgram A-107, June 25, 1975, p. 3.

[17] Wang, K.P. The People's Republic of China, A New Industrial Power With a Strong Mineral Base. Bureau of Mines Special Publication, 1975, 96 pp.

Compañía Colombiana de Clinker S.A. was building a 2,200-ton-per-day wet-process two-line cement plant near Cartegena. Equipment included two kilns 15-½ by 13 by 500 feet, two stoker-type clinker coolers, two 2,000-horsepower raw-grinding Compeb mills, 10-½ by 39 feet, and two finish-grinding Compeb mills of different sizes.

Cementos del Caribe S.A. was installing a wet-process plant at its Barranquilla plant at Cali. Allis-Chalmers provided the major and ancillary equipment, including a 14- by 12-½- by 450-foot rotary kiln and a 7-½- by 71-foot air-quenching cooler.

Cementos del Valle S.A. has placed onstream a new 880-ton-per-day wet-process plant at Cali. Allis-Chalmers provided the major equipment for this coal-fired, wet-process plant, including a 14- by 12-½- by 450-foot rotary kiln, a 7-½- by 71-foot air-quenching cooler, and a dust recuperating and return system.[18]

Costa Rica.—Kaiser Engineers were involved with the Corporacion Costarricense de Desarolla on a prefeasibility study for the construction of a new $50 million cement plant with an annual capacity of 600,000 tons. Location will be at Colorado de Abangeres on the Gulf of Nicoya.[19]

Cyprus.—In spite of the difficulties arising from the political situation, the expansion of Cyprus Cement Co. Ltd.'s Moni plant at Limassol was completed in 1975. The new production line had a capacity of over 275,000 tons of cement per year. Even with the unsatisfactory domestic market, the total output was disposed of, with export sales of 255,000 tons in 1975, compared with 110,000 tons in 1974. The small balance of 43,000 tons was sold to the domestic market.[20]

Denmark.—A/S Aalborg Portland-Cement-Fabrik operated five plants in Denmark and produced 3 million tons of cement in 1975. In 1975 it became the country's sole producer, when the last independent operator joined the group. One of its major export products is white cement, which is shipped to over 60 countries throughout the world.[21]

Dominican Republic.—During 1975 647,000 tons of cement were produced by a State-owned company, with imports accounting for the remainder of the total domestic consumption of 810,000 tons. Two new cement plants scheduled to open soon (one mixed private-state, and the other private) should make the Dominican Republic a net exporter of cement during 1976.

Cementos Nacionales S.A. was building a new 510,000-ton-per-year dry-process plant near San Pedro de Marcoris, scheduled to be onstream in 1976. The Fuller Co. was supplying the major equipment items including a 15- by 220-foot rotary kiln with a four-stage preheater, a 12- by 33-foot raw mill, a 13- by 40-foot finish mill, a clinker cooler, dust collectors, and in-plant control panels.[22]

Ecuador.—La Cemento Nacional C.E.M. has signed a $10 million contract with Allis Chalmers for the construction of a 1,650-ton-per-day cement plant to be built 20 miles west of Guyaquil. Construction was initiated in 1975, and startup was scheduled for 1977.

Allis Chalmers was prime contractor for a cement manufacturing facility expansion near Guyaquil, planned by Comision de Valores-Corporacion Financiera Nacional (CV-CFN), a Government agency in Quito. The $13.5 million dry-process project was scheduled for completion in late 1978, and was the result of a feasibility study by the SNC Group Inc., Montreal, Canada, and conducted for La Comision de Valores of Ecuador, now the principal shareholder of Cementos Selvalegre.[23]

Page 84 of second work cited in footnote 11.

Egypt.—The Ciment Portland Tourah plant was being expanded by an additional 800,000 tons per year. The $30 million project with F. L. Smidth & Co. called for a 16-½- by 263-foot rotary kiln with twin four-stage suspension preheaters and a planetary Unax cooler, a 770-ton-per-day EV crusher, a 16-½- by 22-foot Tirax Unidan mill for grinding raw material, and a 16-½- by 41-foot Unidan finish mill with a 6,850-horsepower Symetro drive. A natural gas and oil mixture was to be used as the plant's fuel source.

In early November 1975, the first vessel in 16 years to travel through the Suez Canal with Israeli-bound cargo carried some 8,500 tons of bagged cement. An agreement signed between Egypt and Israel provided that non-Israeli ships carrying nonstrategic material for Israel could use the canal. The Greek ship *Olympus* carried its Romanian cement through the waterway to the southern Israeli port of Eilat. A war-risk tariff had been set on the cement by a Tel Aviv insurance company which was nearly 27 times higher than the normal premium paid.[24]

France.—Sales of cement by French plants, including exports, were 34 million tons in 1975, an 8.1% decrease compared with 1974. Exports accounted for 2.3 million tons of cement or clinker, or about 7% of total sales. Construction work in 1975 was about 2.6% lower than in 1974.[25]

Germany, West.—West Germany's cement production in 1975 was 36.9 million tons, a 6.9% decrease compared with 1974. At the end of 1975, cement production capacity was 48.5 million tons, which indicated a 76% utilization of capacity for the year. No new plants or plant expansions occurred during the year. Exports for the year were 1.8 million tons. Residential construction and other construction work slackened during the year, and the expected economic upswing in West Germany failed to materialize in 1975.

Polysius A.G. received a contract from Dyckerhoff Cement for a 21-foot-diameter counterflow preheater rated at 660 tons per day of clinker for the production of white cement.[26]

Greece.—During 1975, Greek cement production capacity reached 10 million tons, and the cement industry invested about $62 million in new installations. Production of cement was 8.7 million tons, a 12% increase compared with 1974. Exports were particularly important, with 3.3 million tons exported to mostly Middle East and North African countries—a 50% increase compared with 1974.

A new cement plant, with a capacity of 1.1 million tons per year, went onstream in Kamari, Beotea the fourth 1.1-million-ton-per-year plant of Titan Cement Co. Construction continued on General Cement Co.'s 1.7-million-ton-per-year plant at Volos and on Chalkis Cement Co.'s 1.1-million-ton-per-year cement plant at Mikro Vathy, Aulis, near Khalkis. With the completion of these two plants, scheduled for 1976, the cement-producing capacity of Greece will be 12.1 million tons per year. The Government of Greece has authorized investments, totaling $300 million, in six new cement plants. No siting or capacities for new plants were mentioned.

The first cement plant to be built in Greece was in fact the first plant in the whole Balkan and Middle East area, and was erected by the Titan Cement Co., at Eleusis in 1911. There are now seven plants producing cement in Greece, operated by four companies; two more are under construction, and several more are planned.

Virtually all the cement produced in Greece (97% to 98%) is a gray portland cement with sometimes either 10% or 20% pozzolan (Santorini earth) added to make a Hellenic-type portland cement. Most producers have their own quarries for clay and limestone near the plants, but gypsum is shipped mainly from Crete and the Ionian Islands, while pozzolan comes from the Island of Thira.

M. A. Karageorgis, S.A., has contracted with Kaiser Engineers to handle engineering and construction management for a 1.1-million-ton-per-year, $43 million cement plant to be located at Messinia.[27]

Haiti.—Le Ciment d'Haiti, S.A. completed an expansion program at its plant at Fond Mombin, Commune de l'Arcahaie. The Fuller Co. supplied the major equipment to the project, including an 11- by

[27] Industrial Minerals. No. 75, December 1973, pp. 34, 36.
U.S. Embassy, Athens, Greece. State Department Airgram A–73, May 14, 1976, p. 8.
Page 84 of second work cited in footnote 11.

32-foot finish mill, an 18-foot-diameter air separator, pneumatic conveying equipment, and in-plant dust collectors.[28]

Hungary.—A new cement plant with an annual capacity of 1.7 million tons went onstream in 1975 at Hejöcsaba, a suburb of Miskolc, Hungary's second largest city and center of an industrial region. This plant has two production lines and was the largest newly erected cement plant in Eastern Europe. Since 1960, four major cement plants have been built in Hungary; the first two were 1.1-million-ton plants at Vac on the Danube north of Budapest in 1972, and the fourth, under construction at Bélapátfalva near the Czechoslovakian border, will be operational in 1978 and have a capacity of 1.3 million tons. Imports of cement have been amounting to over 1 million tons per year, 70% of which is supplied by the U.S.S.R. Once the Bélapátfalva plant is operational, Hungary expects to be self-sufficient in the cement category.[29]

Indonesia.—Kaiser Cement & Gypsum Corp.'s 51%-owned Indonesian affiliate, Cibinong Cement Co., placed onstream in 1975 a new cement plant at Cibinong, near Bogor, West Java. Initial rated capacity is 550,000 tons per year. The firm immediately embarked on a $48 million, 100% expansion project to be completed in 1977. The Fuller Co. will supply a 15- by 220-foot rotary kiln with a four-stage preheater.

Mitsui & Co., Ltd., and other Japanese and Indonesian interests announced initiation of construction of an integrated cement plant with a capacity of 660,000 tons per year at Cilacap in Central Java.

Early in 1975, the Asian Development Bank announced the loan of $37 million to Indonesia for a large cement plant at Baturaja, South Sumatra. This was the largest loan so far to Indonesia, in which the total cost, including local currency, was $57 million. Annual capacity will be 550,000 tons per year, and a special feature was that, while the clinker will be produced at Baturaja, the finish grinding and preparation will be at the two principal consuming-market areas of Palembang and Telukbetung. No further implementation was known.

The Government of Indonesia was planning a 1-million-ton-per-year cement plant expansion at Gresik, East Java. Cost was not disclosed, but the Export-Import Bank has approved a loan toward the project.[30]

Iran.—By the middle of 1976, operations are to be initiated at the 3-million-ton-per-year Isfahan slag cement plant located in the Kuhi-Rud highlands, 260 miles south of Teheran. Isfahan's production will double the current cement output of Iran's present 10 cement facilities. The plant will have two production lines, each with a designed clinker capacity of 3,600 tons per day. Granulated blast furnace slag from the neighboring iron and steel plant will be utilized. Isfahan's burning plant will involve some of the largest heat exchange rotary kilns with satellite coolers ever built. The kilns are 19 feet in diameter by 290 feet long and are equipped with four-stage twin-type Humboldt heat exchangers. Each kiln is fired with natural gas.

A new 770,000-ton-per-year cement plant was under construction near the Iranian winter resort of Abe-Ali, about 28 miles northeast of Teheran. The Shemal Cement Co., which belongs to the Teheran Cement Co., has stated that this plant will start early in 1978.

The Soufian Cement Co. was expanding its plant near Tabriz by a fourth production line of 2,200 tons per day. F. L. Smidth & Co. was supplying equipment, including a 3,950-horsepower raw mill, two 23-foot-diameter air separators, a 16-½- by 263-foot rotary kiln with a four-stage suspension preheater and planetary cooler, and a 4,550-horsepower finish mill.

Iran's Fifth Economic Development Plan called for a level of industrial output requiring substantial increases in its cement industry base. Production will have to rise from 4.0 million tons in 1975 to 22 million tons per year by the plan's completion.[31]

Iraq.—The Badoosh cement plant in northern Iraq was reportedly increasing production by 1,650 tons per day through the incorporation of the Polysius A.G.

Page 102 of work cited in footnote 6.
Page 82 of second work cited in footnote 11.

dry-process system. The plant's original equipment, installed by Polysius some 20 years ago, consisted of two wet-process kilns with a capacity of 660 tons per day. New Polysius units included a 14- by 236-foot rotary kiln, a counterflow preheater, a raw mill, a finish mill, two air separators, and pneumatic conveying equipment.

F. L. Smidth & Co., Copenhagen, announced that the firm had received the largest single order in its 100-year history from the Republic of Iraq's Ministry of Industry. The $225 million contract called for the construction of a new four-kiln cement plant with a 2.2-million-ton-per-year capacity at Kufa, 112 miles south of Baghdad. Major equipment included four rotary kilns with Unax coolers, each with an output of 1,650 tons per day, four Unidan raw mills, three Sonex-Unidan cement mills, and six Fluxo packers. The plant was scheduled to commence production in stages, with full completion in 1978.

Société Fives-Cail Babcock reported it had signed a contract in Iraq for a cement plant with a capacity of 1,650 tons per day. Valued at $38 million, the project was scheduled to become operational in June 1977.

Iraq's Minister of Industry and Minerals reported at yearend that contracts for the construction of a cement plant with a capacity of 2.2 million tons per year would be awarded shortly in an effort to reach an overall production target of 7.7 million tons per year of cement by 1977. A 9.9-million-ton annual industry capacity was stated to be Iraq's cement goal for 1980.[32]

Ireland.—The recession in Ireland reached its low point in 1975, and recovery was slow. Stimulated by an increase in building activity during the latter part of 1975, cement sales in the third and fourth quarters increased 7% and 6%, respectively. Inflation was a serious problem throughout 1975, standing at 21% for the year.

Cement-Roadstone Holdings Ltd., Ireland's largest industrial company, announced that it was more than doubling the capacity of its Platin cement plant to 1.1 million tons per year. F. L. Smidth & Co. will supply a roller mill and an 18- by 290-foot, 3,300-ton-per-day dry-process kiln with planetary cooler and twin four-stage suspension preheaters. The project was expected to be completed by early 1978, with the new operation replacing the 38-year-old Drogheda cement works. Roadstone's decision to expand Platin was based on growth in Ireland's cement demand and developments in cement machinery and automation that made the Drogheda plant uncompetitive with the newer European facilities.[33]

Italy.—Estimated consumption of cement in Italy in 1975 was 37.4 million tons, compared with 39.7 million tons in 1974, a 6% reduction. Exports were also slightly less in 1975 with about 384,000 tons going mostly to non-EEC-member countries.

SpA Cementerie Calabro Lucane (Italcementi group) started up a new cement plant in 1975 at Castrovillari in southern Italy. Raw materials come from two quarries linked to the plant by a belt conveyor 6.2 miles long. An investment of $634,000 has been made in the mill. Its automated control systems are joined to a computer in a sister plant at Matera.[34]

Jamaica.—The Caribbean Cement Co. Ltd. initiated a $25 million expansion of its Rockfort plant to double capacity from 440,000 to 880,000 tons per year. Major Allis-Chalmers equipment included a 14- by 197-foot kiln and suspension preheater rated at 1,430 tons per day, a cooler, a 1,000-horsepower MPS roller mill rated at 130 tons per hour, and a 4,500-horsepower finish-grinding Compeb mill, 13- by 45 feet, rated at 123 tons per hour. As of the end of 1975, the expansion project was halted by labor unrest.

The Government of Jamaica and the Government of Venezuela formed a joint venture to explore the possibility of establishing a second cement plant in Jamaica. A 660,000-ton-per-year operation was envisioned, and would be geared to handle the shortages in local production, with some exports to other Caribbean countries.[35]

Japan.—Production of cement in Japan in 1975 was 72.2 million tons, a 10.4% decrease from 1974, but for the first time outproduced the United States (by 3.6%). Plant expansions comprising four large kilns with a total capacity of 4.1 million tons per year, coupled with improvements in existing capacities, increased the total cement production capacity of Japan to 122.6 million tons per year. The utilization of capacity was only 58.9% in 1975, compared with 69.2% in North America and 75.2% in total EEC member countries. Japanese exports of cement in 1975 totaled 4.5 million tons.

Aso Cement Co. placed an order with F. L. Smidth & Co. for expansion of its Tagawa plant. Equipment included a 15-½- by 246-foot, 4,400-ton-per-day rotary kiln, with twin cyclone preheaters and a precalciner in one of its strings. It was scheduled for full operation by early 1977.

Mitsui Cement Co. of Tokyo revealed a $33 million plan to significantly increase the capacity of its Tagawa plant in Fukuoka Prefecture. When the expansion is completed in 1976, production capacity will be increased 60% to 4.1 million tons annually.

Nihon Cement Co. withdrew its plan to acquire a controlling interest in Ryukyu Cement Co. of Naha, Okinawa, because the Japanese Fair Trade Commission ruled that it was monopolistic. Nihon had previously signed a contract with Kaiser Cement & Gypsum Corp. to purchase Kaiser's holdings for $9 million.[36]

Jordan.—The Jordan Cement Co. signed an agreement with Polysius A.G. to establish a cement plant with a 2,200-ton-per-day capacity. Equipment included a 15- by 246-foot rotary kiln with a cyclone preheater, an air-swept raw mill, a finish mill, two air separators, a homogenizing system, and a pneumatic conveyor system.[37]

Korea, Republic of.—In 1975, the Republic of Korea produced 11.2 million tons of cement, a 15% increase compared with 1974. The average price of cement in 1975 was 15,000 won ($30.92) per short ton. The cement industry in Korea is privately operated, but government backed as part of the economic development program. By 1977, total production is expected to reach 25 million tons annually, with 14 million tons used domestically, 7.7 million tons exported, and a reserve of 3.3 million tons.

Tongyang Cement Manufacturing Co. of Seoul started an expansion project at its Samchok plant on the northeast coast of Korea. The Fuller Co. supplied two 16- by 245-foot rotary kilns with four-stage twin Fuller preheaters, two 13- by 45-foot raw mills, three 13- by 45-foot finish mills, 10- by 70-foot rotary dryers, a 48- by 60-inch jaw crusher, and a 42-inch gyratory crusher.

The Ssangyong Cement Industries Ltd., Seoul, awarded a European consortium a contract for expanding the capacity of its Tonghae works, near Pukpyong-ni on the northeast coast of Korea, by 6.2 million tons of cement annually. This was the largest plant of its kind in the world. The order comprised planning and delivery of plant and equipment in the total amount of $125 million, with an option on a further expansion phase valued at $65 million. Overall management of the contract rested with the French consultants, Polysius S.A. of Rueil-Malmaison, France.[38]

Kuwait.—Founded in 1968, the Kuwait Cement Co. was the largest producer of cement in the country in 1975. Annual capacity of the Shuaiba plant was 330,000 tons. Iraqi clinker and gypsum were imported for the production of three types of ordinary and sulfur-resistant cement. Kuwait construction activities increased significantly during 1975, and the export and reexport of cement were banned late in the year.

A Japanese team of Onoda Cement Co. and Mitsui & Co. Ltd. was reportedly outbidding British, Spanish, and other groups in an international tender for 330,000 tons of cement clinker placed by the Kuwait Cement Co. for delivery over a 1-year period starting in March 1976. It was also reported that tenders were out for some 22,000 tons of bagged cement to be delivered on a 2-year contract.[39]

Lebanon.—Lebanon's economic situation seriously worsened since April 1975 as the result of the continuing political struggles and the civil war. Building and construction activities suffered from the warlike conditions. It was somewhat surprising that cement consumption in Lebanon during 1975 dropped only 16% to slightly over 1 million tons, and an additional 410,000 tons was exported. Sales of cement fell sharply during the last quarter of 1975, and production was temporarily suspended.

Pages 102–103 of work cited in footnote 6.

The Lebanese White Cement Co. placed a $5.4 million order with Buhler-Miag of West Germany for expansion equipment for the Chekka plant. Equipment consisted of a 350-ton-per-day rotary kiln for production of white cement and additional capacity in raw and finishing mill processing. The new extension was expected to be onstream by October 1976.[40]

Libya.—Humboldt Wedag was awarded an order for two 1,650-ton-per-day rotary kilns and preheater systems to be installed in a cement plant at Hawari, a suburb of Benghazi. The turnkey plant was to be supplied and erected by KHD Industrieanlagen A.G. of West Germany.[41]

Mexico.—Cement production in Mexico was 12.8 million tons in 1975, an increase of 9.6% compared with 1974. After an initial downturn in the first half of 1975, construction activity improved, and according to the economic forecast of the Banco Nacional de Mexico, building materials could expect a growth rate of 12%. Inflation amounted to 10% on an annual basis.

Cement Apasco S.A. of Mexico City commissioned in August 1975 a new production line of 2,800 tons per day of clinker, which raised the total plant capacity to 1.5 million tons per year. During the year, Cementos Veracruz S.A., in which Cementos Apasco holds a majority interest, commissioned a new production line in its Orizaba plant with a capacity of 1,320 tons per day.

Cementos Hidalgo, SCL, was expanding its Hidalgo plant in 1975. F. L. Smidth & Co. supplied a 1,650-horsepower raw mill, a 1,500-horsepower finish mill, and a rotary packer.

La Cruz Azul SCL scheduled its newly expanded Hidalgo plant for full operation in 1976. The Fuller Co. supplied a 17- by 270-foot rotary kiln with a four-stage twin preheater, a clinker cooler, and pneumatic conveying and blending equipment.

Cementos de Chihuahua completed an expansion program and commissioned the plant in late 1975. The Fuller Co. supplied a 13- by 39-foot finish mill.[42]

Morocco.—The Société Nationale d'Investissement (SNI) planned the construction of a new 440,000-ton-per-year cement plant near Marrakech. It is the first operation promoted and financed by SNI.

Another new cement company, Cimenterie Maghrebine initiated construction of a 1.1-million-ton-per-year facility at Oujda, near the Algerian border. The company is a joint venture between the Moroccan and Algerian Governments. The Consultancy Services Div. of The Associated Portland Cement Manufacturers Ltd., Blue Circle Group, will be responsible for the design, engineering, and supervision of construction of the plant, together with training of Moroccan personnel to man it. Polysius A.G. was awarded the order to provide two cyclone preheater kilns; 31 feet in diameter by 351 feet long with planetary coolers, rated at 2,000 tons per day each, two airswept raw mills, two cement mills, air separators, and homogenizing and conveying equipment.[43]

Mozambique.—It is estimated that only 300,000 tons of cement were produced in Mozambique, decreasing 55% compared with the alltime high of 674,000 tons in 1973. Companhia de Cimentos de Moçambique has three plants at Maputo (Matola), Beira (Dondo), and Nacala, with an estimated total annual capacity of 1 million tons. An almost complete paralysis in housing construction, the flight of most of the European technicians, lack of logistic support, and decrease in productivity accounted for the poor showing in 1975.[44]

Nepal.—The Himal Cement Co. made available its first consignment of 1,000 bags of cement to National Trading Ltd., its sole distributor, for marketing. The price of the Nepalese cement was fixed at NRs.45.00 ($3.60) per 94-pound bag.[45]

Netherlands.—The Netherlands economy suffered a considerable setback during 1975 with an estimated falloff of 2% in the real gross national product (GNP). Inflation remained at a high level of 10.5%. The construction sector was in a state of malaise, and total Dutch cement consumption was 6.1 million tons in 1975, a decrease of 5.6% compared with that of 1974.[46]

New Zealand.—New Zealand's economy was marked by stagnation in 1975, with the GNP falling by 3.5% in real value. Housing permits fell by 11%, and cement consumption drifted down 3% to 1.2 million tons for the year.

The new third kiln of the Westport plant of New Zealand Cement Holdings, Ltd., was commissioned in July 1975 according to plan, while the whole expansion program is expected to be completed in the first quarter of 1976.[47]

Nicaragua.—Production of cement in Nicaragua was 213,000 tons in 1975, an 18.1% decline from the record year of 1974. Utilization of capacity was 72%. The peak of the reconstruction of Managua from the devastating earthquake of 1972 was apparently reached in 1974, and the present unused cement plant capacity remains to be absorbed with the economic development of the country.[48]

Nigeria.—The Associated Portland Cement Manufacturers Ltd. (Blue Circle Group) participated as management partners in a northeastern Nigerian cement plant project known as Ashaka Cement, which was scheduled to go onstream by the end of 1977. Polysius A.G. supplied the turnkey plant with two GEPOL kiln lines with a rated capacity of 330,000 tons per year each. The actual site was at Ashaka on the Gongola River and was the first cement plant in the northeastern section. It was expected to play a significant role in the economic development of the region.

F. L. Smidth & Co. has been awarded a contract (under a Blue Circle management contract) to supply a new two-kiln cement plant at Shagamu, about 40 miles northeast of Lagos. Major equipment included two 1,100-ton-per-day rotary kilns, 15 feet in diameter by 500 feet in length, with coolers and electrofilters, and two 3,000-horsepower finishing mills, 12-1/2 feet in diameter by 38 feet long.

Nigeria also received special world attention in 1975. The 5-year plan of the oil-rich country somehow led to the contracting of some 23 million tons of cement worth $1 billion—about 10 times the total amount that the country's ports could handle in a year. The result was that over 400 ships, 250 of them carrying cement, lay at anchor outside the Lagos harbor. Amid legal actions, high demurrage costs, and deteriorating cement, a special tribunal was set up by the Nigerian Government, and the request was made to halt any further shipments. At best, Lagos port of Apapa was not expected to be unscrambled for a year.[49]

Norway.—Norway's largest producer of limestone and its sole producer of portland cement is A/S Norcem of Oslo, established in 1968 by a merger of three companies. Present total output of the three plants is between 5.0 and 5.5 million tons of limestone annually and 3.0 million tons of cement.

In 1975, Norwegian cement production increased by 169,000 tons to 3.1 million tons, the largest annual output ever achieved. Cement sales in Norway totaled 1.9 million tons, and exports, mainly to West Africa and the United States, totaled 1.1 million tons.[50]

Pakistan.—The State Cement Corp. planned to increase cement production in Pakistan by 1.65 million tons annually, scheduled for completion in about 3-1/2 years. Projects also started on the expansion of production in the Javedan and Mustehkam cement plants by an additional 330,000 tons per year each. Further plans called for the installation of cement plants at Spintungi near Sibi in Baluchistan, at Gadani in the Lasbela district, and at Kohat in the North-West Frontier Province. Exports were prohibited because of the increased domestic demand.

The State Cement Corp. awarded a contract to the Fuller Co. for a new 1,100-ton-per-day plant in Karachi.[51]

Panama.—Empresa Estatal de Cemento Bayano awarded a $60 million contract to F. L. Smidth & Co. for the construction, on a turnkey basis, of a new 1,100-ton-per-day cement plant near Calzada Larga, north of Panama City. Equipment included a 13-½- by 191-foot rotary kiln with a four-stage suspension preheater and planetary cooler, a 770-ton-per-day crusher, a roller mill, a 14- by 40-foot finish mill, and two digital computer systems for control, suspension, and reporting of plant operations.[52]

Peru.—Compensation negotiations continued during the year concerning the nationalization of Cementos Lima S.A. in 1974. Some progress was made, and it was anticipated that the negotiations will not be concluded before mid-1976.

Cementos Lima S.A. initiated work on doubling the capacity of its Atacongo plant to 6,600 tons per day. Completed by Holderbank in 1969, the expanded plant was expected to be operational by the end of 1978. New equipment included a 6,000-horsepower raw mill, a 6,000-horsepower cement mill, and a precalcining kiln which would be the first such unit installed in the Americas.

Cementos Norte Pacasmayo planned an $18 million expansion project to increase the capacity of its plant to 2,400 tons per day of cement. The Fuller Co. and General Electric Co. were supplying equipment, including a 13-½- by 190-foot rotary kiln with suspension preheater, a 13- by 45-foot raw mill, a 12- by 45-foot finish mill, blending and conveying equipment, and four dust collector units.[53]

Philippines.—The economic development of the Philippines continued at a high level in 1975; real GNP rose by 5.9%. The upswing in the construction industry was a notable feature; private construction benefited from good demand with an 11% increase, and public construction boomed with a 22% increase. Philippine cement consumption increased 24% to 3.9 million tons. Exports rose 5% to 900,000 tons.

Société Fives-Cail Babcock obtained a contract, on a turnkey basis, for the design, fabrication, and installation of a cement plant with a capacity of 1,880 tons per day, located at Balingbing, Rizal, Philippines.[54]

Portugal.—Cement production in Portugal was 3.7 million tons in 1975, an increase of 9% compared with 1974. Cement production capacity was 5.1 million tons per year at the end of 1975, indicating a 73% utilization of capacity for 1975.

In mid-1975 the Portuguese Government continued its nationalization programs with the taking over of the country's cement industry. A national cement company, known as Cimpor-Cimentos Poruguese, may be the result of this takeover.

Secil-Companhia Geral de Cal e Cimento was expanding its cement plant production at Setubal with a $48 million project.[55]

Qatar—The Qatar National Cement Co. placed at $7 million order with Buhler-Miag of West Germany for a new rotary kiln for the company's Umm-Bab plant near the capital of Doha. The kiln measured 11-½ feet in diameter by 344 feet in length, and will have a capacity of 385 tons per day of clinker. Other equipment in the contract included a raw mill handling plant and clinker conveyors.[56]

Saudi Arabia.—Saudi Arabia's new 5-year development plan for 1975–80 called for a substantial expansion of its port facilities to handle some 14 million tons of cargo per year, and an increase in the country's cement production from the current 1.2 million tons per year to 11 million tons.

The Saudi Cement Co. at Dammam expanded its Hoffuf cement plant in eastern Saudi Arabia with a new 1.1-million-ton-per-year expansion and modernization. Two complete dry-process lines with a capacity of 550,000 tons per year each were awarded to Polysius A.G. at a total turnkey contract cost of $85 million. Modernization of the existing three kilns, originally installed by Polysius between 1959 and 1968, was also completed, including electrostatic precipitators, power stations, and a process automation system. This order represented the largest order ever given to Polysius A.G.

Yanbu Cement Co. of Saudi Arabia awarded a feasibility study to Naigai Consultant Co. of Tokyo for the construction of two cement plants with a total production capacity of 1,650 tons per day in the Yanbu area on the Red Sea.

A French company won an initial contract for the construction of a cement plant at Buraydah with a capacity of 2,200 tons per day. It is expected to be onstream in 3 years. French experts also made studies on a 2,200-ton-per-day plant at nearby Qasim.[57]

Somalia.—In October 1975, ground was broken for a $12 million, 110,000-ton-per-year cement plant at Suryo Malable, southeast of Berbera. The project, jointly financed between the North Korean and the Somali Governments, is to begin operation in mid-1977[58]

South Africa, Republic of.—The South African economy in 1975 was materially influenced by the worldwide recession. Cement consumption in 1975 declined 1.1% to 7.6 million tons compared with that of 1974. The housing sector improved toward yearend. Members of the local Cement Producers Association have stopped all plant expansion efforts until demand and price combine to permit additional investment allowances.[59]

Spain.—Cement production in 1975 increased 1% to 26.4 million tons. Total production capacity was 33 million tons. Thus, Spain achieved an 80% utilization of capacity, in spite of a 6% dropoff in domestic consumption. Exports were 3.7 million tons, more than double those of 1974, placing Spain among the world's principal exporters of cement.

During the year a new production line was erected in Spain by Polysius A.G. Equipment included a 3,300-ton-per-day DOPOL kiln with a planetary cooler.[60]

Sudan.—Two U.S. companies—Buttes Gas and Oil and KH International—initiated construction of a $40 million, 440,000-ton-per-year cement plant on the Red Sea. A Sudanese company, Cement Production (Sudan), was participating with the construction. The operation was to furnish part of Sudan's requirements and export the balance to the Middle East market.[61]

Switzerland.—Cement production in 1975 was 4.2 million tons, a 26% reduction compared with 1974. Total capacity was 7.4 million tons, indicating a utilization of only 58% of capacity for the year, mostly because of the steep decline in cement consumption in Switzerland. Only insignificant tonnages were exported.

The most modern cement plant in Switzerland, the new Rekingen-Mellikon plant of Cementfabrik Holderbank, was brought into operation in mid-1975. This dry-process plant had a production capacity of 770,000 tons per year.[62]

Syria.—The Syrian Government planned to raise annual cement production from 1.1 million tons per year in 1975 to 6.6 million tons by 1980. East Germany was building four plants—at Hamah, Tartus, Aleppo, and Adra. The expanded 7,000-ton-per-day Tartus plant was scheduled for completion in December 1978; Aleppo was due for operation in 1975; Hamah and Adra are to begin in 1976 and 1977, respectively. In midyear a further boost took place in already close Syrian-Romanian economic relations. Import-Export of Romania signed a contract in Damascus for $110 million to build the 3,300-ton-per-day cement plant at Aleppo.[63]

Taiwan.—The Tang Eng Iron Works was constructing a new cement plant with a capacity of 660,000 tons per year at a cost of $26 million. Completion was scheduled for mid-1976. The plant is located near Ilan in northeastern Taiwan, and a portion of the output will be exported.

An expansion project of the Cheng Tai Cement Co. in Taipei was initiated and was scheduled for full operation early in 1976. The Fuller Co. supplied a 13-½- by 195-foot rotary kiln with a four-stage preheater, a Fuller-Loesche roller mill, and a 12- by 38-½-foot finish mill.

The Fuller Co. also completed another capacity expansion at the Chia Hsin Cement Corp. They supplied the major equipment including a 15- by 220-foot rotary kiln with a four-stage preheater, two Fuller-Loesche roller mills, and an 11- by 32-foot finish mill.

[62] Works cited in footnotes 7 and 8.

[63] Page 103 work cited in footnote 6.

The Kuan Hsi Cement Corp. started the construction of a new cement plant at Kaohsiung, with a capacity of 1.3 million tons per year at a cost of $40 million. Government enterprises were responsible for construction, and installation of machinery was handled by the Tang Eng Iron Works.

The new 2,600-ton-per-day dry-process cement plant of the China Rebar Co., Ltd., at Tungsha was under construction and scheduled for completion by mid-1976. Allis-Chalmers furnished all the major equipment, including a 16- by 230-foot rotary kiln with suspension preheater, a 1,750-horsepower roller mill rated at 198 tons per hour, a 550-horsepower finish-grinding mill, 14 feet in diameter by 46 feet in length, rated at 116 tons per hour, and other accessory equipment.[64]

Thailand.—The International Finance Corp., an affiliate of the World Bank, lent $10 million to help finance a $62 million expansion program for the four companies in the Siam Cement Group. Siam Cement Co. Ltd.'s portion of the plan called for an additional 880,000 tons per year of cement capacity, two cement distribution centers at Bangkok, and facilities for loading clinker on oceangoing vessels. The increase in cement output was to meet the growing demand and to take advantage of the export market in the area.[65]

Togo.—The Government of Togo planned to double Ciments du Togo's cement plant capacity to 275,000 tons per year. In mid-1975, all export licenses were canceled in an attempt to alleviate domestic shortages caused by the foreign demand for much of Togo's 140,000-ton annual cement output.

Blue Circle Group's consultancy services signed an agreement with Les Ciments de l'Afrique de l'Ouest (CIMAO), a Togo company, to provide engineering services for a new cement industry. CIMAO was a joint venture between the Governments of Togo, the Ivory Coast, and Ghana, and was set up to provide an integrated cement industry for the three countries. CIMAO proposed to build a 1.3-million-ton-per-year clinker plant in the area of Tabligbo, 36 miles northeast of Lomé, the capital of Togo. The clinker would be shipped from the plant to Lomé, both for grinding into cement for Togolese use and for shipment to Ghana and the Ivory Coast. The plant would be a two-kiln dry-process operation, and was planned to come onstream in 1979.[66]

Trinidad and Tobago.—The Government of Trinidad and Tobago proposed the construction of a new 330,000-ton-per-year cement plant rather than expanding the existing 300,000-ton-per-year facility of Trinidad Cement Ltd. A technical appraisal of the present plant will be completed before implementation of the new plans. If the appraisal is favorable, startup is scheduled for 1978.[67]

Turkey.—Cement production in Turkey was 11.8 million tons in 1975, a 4.9% increase compared with that of 1974. Cement production capacity also increased to 16.1 million tons annually, indicating a 74% utilization of capacity for the year. Increase in production capacity for 1975 included 2.8 million tons per year in new kilns and 800,000 tons per year in improvement of existing capacities. Total exports of cement were 980,000 tons, mainly to Bulgaria, Syria, Iran, and neighboring Middle East countries.

Construction of a 550,000-ton-per-year cement plant was initiated at Yozgat, Central Anatolia. Financing for the plant was arranged through a $7.7 million loan from the European Investment Bank. Approval of the loan was in support of a plan through which Turkish workers in Western Europe were able to invest their savings in the industrial development of their own country. The plant was established by Yozgat Isçi Birligi Insaat Malzemeleri ve Sanayi, a joint stock company formed in 1973. Lignite mined in Turkey will be used as fuel.

The Darica plant of Aslan ve Eskihisar Müttehit Çimento ve Su Kireci Fabrikasi A.Ş. initiated a project to double its cement production capacity to 1.1 million tons per year by 1977. The total project will cost $31 million, of which the International Finance Corp. lent $10.6 million to support the project.

The Turkish Economic Press Agency reported that the $27 million cement plant of the state-owned Türkiye Çimento Sanayii T.A.Ş, located in Mersin, was inaugurated in midyear. The plant capacity is 1.5 million tons per year.[68]

U.S.S.R.—The Soviet Union is the largest producer of cement in the world, with an estimated production of 134 million tons in 1975, a 6% increase compared with 1974. About 1965, the U.S.S.R. surpassed the United States in cement production, and it has had an indicated growth rate of 3.2% for the last 15 years. During this same period, U.S. portland cement production had an indicated growth rate of only 1.2%.

In 1975, the Moscow Research Institute established a CEMBUREAU-type organization for the countries belonging to the Council for Mutual Economic Assistance (CMEA). The new organization, known as the Cement Industries' International Coordination Center, will coordinate all research carried out in the CMEA countries, with joint activities planned in some 30 research topics. A central objective of the effort was the development of dry-process cement manufacture.[69]

United Arab Emirates.—The Société Fives-Cail Babcock was given contracts for a 770-ton-per-day cement plant for the Emirate of Sharja at the new industrial city, and a 660-ton-per-day cement plant for the Emirate of Abu Dhabi.[70]

United Kingdom.—Production of cement in the United Kingdom was 18.6 million tons in 1975, a 5.0% decrease compared with that of 1974. At the end of 1975, cement production capacity was 24.7 million tons annually, which indicated a 75% utilization of cement production capacity. Exports were 770,000 tons for the year, and domestic consumption was down 4% compared with 1974. The closing of one plant and the mothballing of kilns at six other plants effectively reduced available capacity by over 2.2 million tons per year.

In Wales, an expansion project for the Aberthaw plant of Aberthaw and Bristol Channel Portland Cement Co. near Barry, South Glamorgan, was completed. The new production line consisted of a kiln and preheater, raw material grinding plant, and precipitator plant. The new kiln was stated to be one of the most advanced in the United Kingdom, capable of producing at least 1,500 tons of clinker per day, and boosted total output of the plant to 3,100 tons per day.[71]

Upper Volta.—Plans were implemented to construct a cement plant with a capacity of 80,000 to 100,000 tons per year at Tin Hrassan.[72]

Venezuela.—Venezuela produced 3.8 million tons of cement in 1975, a 1.1% decrease compared with that of 1974. Cement shortages led to increased imports from Puerto Rico.

Holderbank Consulting Ltd., Mississauga, Ontario, Canada, was awarded a contract by Cementos Caribe S.A. of Caracas for engineering and project management for a new, 3,300-ton-per-day cement plant at Puerto Cumarebo, near Coro. The dry-process plant will consist of a preblending system, a fuel-economizing preheater rotary kiln with partial precalcining, process automation, and a marine distribution system. Construction will be initiated in 1976, and production is scheduled for 1978.

C. A. Venezolana de Cementos had two expansion programs underway with F. L. Smidth & Co. At the Pertigalete plant, a new 12- by 13-½- by 472-foot Unax rotary kiln, with a 3.1-million-ton-per-year capacity was being installed. At Maracaibo, F. L. Smidth & Co. also supplied a 12- by 450-foot rotary kiln with a 410,000-ton-per-year capacity.[73]

Yemen Arab Republic.—The new 220,000-ton-per-year wet-process cement plant built by the Soviets at Bajil, some 30 miles from the southwest Yemen Red Sea coastal port of Hodeida, was in operation. The U.S.S.R. supplied the equipment and trained the Yemenese staff in the Soviet Union.[74]

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Includes production from the Azores and Madeira Islands as follows, in thousand short tons: 1973—Azores 22, Madeira 35; 1974—Azores 15, Madeira 34; 1975—not available. The balance of output in each year was from continental Portugal.

[2] Year beginning March 21 of that stated.

TECHNOLOGY

A new cement production process developed in Japan has been licensed to a French engineering company under a recently signed agreement. Developed by Kawasaki Heavy Industries Ltd. and Onoda Cement Co. and licensed to Cruesot-Loire Enterprises, the process involved a reinforced suspension preheater (RSP) for dry-process operation, which it was claimed made possible the production of cement at rates three times those of conventional suspension preheaters. At the same time, it was said that the RSP process also reduced harmful atmospheric emissions during cement production.

In the new process, a combustion furnace with a special burner is placed between the cement kiln and the suspension preheater to decarbonate approximately 90% of the raw materials before they enter the kiln. This reduces the thermal load of the kiln and increases its efficiency, enabling an improvement of the cement production rate. Onoda Cement Co. made a full-scale application of the process in 1972 and in 1974 completed a 3,000-ton-per-day plant at its Ofunato works adaptable to the RSP process. Kawasaki was responsible for development of the RSP hardware. At a 2,700-ton-per-day production rate with the RSP process, specific kiln loading was measured at 10.2 pounds of clinker per cubic foot of kiln shell volume per hour. The developers see a possibility of producing 4,000 tons per day in a 14.8-foot-diameter kiln and more than 7,000 tons per day in a 18-foot-diameter kiln. The process is considered applicable both to existing suspension preheater kilns by modification and to new installations.[75]

In 1975, Brown Boveri & Cie., Baden, West Germany, installed the first gearless cement mill drive in Switzerland. The installation took place at Holderbank's new 770,000-ton-per-year Rekingen Aagau cement plant. The gearless drive had a rating of 5,200 kilowatts. In recent years in Central Europe, and especially in West Germany, the use of gearless drives for tube mills in the cement industry has gained increasing acceptance.[76]

At the Brevik plant of A/S Norcem, Norway, a new system was installed in 1975 for feeding the pelletized feed into the grate of the furnace. Rather than an ordinary chute feed, a Sala reciprocating conveyor was used, which handled the pellets gently and spread them in an even layer over the grate without crushing. In the first month after installation, capacity increased by 23%, with a reduction in oil consumption of 13%.[77]

A survey and comparison of U.S. cement plant operating developments indicated the direction the future may take. It is summarized as follows:

1. It will be impossible to replace all of the present wet capacities with dry plants in the foreseeable future. Therefore, the thermal efficiency improvement of present systems will be most imperative.

2. Fewer conversions of existing plants from wet to dry than originally anticipated will actually be undertaken, because the return-on-investment will be very marginal.

3. In all new plants, the concept of larger single-kiln plants will have to be adopted.

4. The trend to large single-kiln plants will further reduce manpower requirements and will give significant improvements in fuel and power savings.[78]

In 1975, the Japanese firm of Ishikawajima-Harima Heavy Industries, Ltd. claimed that the new SF sintering process set record figures in both throughput and heat requirements for cement clinker burning. In addition, the lifespan of the kiln brick was greatly prolonged owing to the reduction in heat load at the kiln's sintering zone.

Also announced by Ishikawajima-Harima in 1975 was the development of a new, highly efficient electrostatic precipitator. Called the EP-ES type, after exhaustive testing it was proved that the exist dust concentration could be reduced to less than 0.03 grams per normal cubic meter under full operating conditions. The precipitating capacity was extremely stable compared with the conventional type, while working under wide fluctuations of dust concentration, gas flow rate, and gas temperature at the inlet.[79]

Chromium

By John L. Morning [1]

Domestic demand for chromium in 1975 dropped to about the same level as that of 1971 after establishing a record high in 1974. Although there were no sales of government chromite stockpile excesses, delivery of chromite from prior year contract sales totaled nearly 418,000 tons, some of which was exported. Despite reduced demand for chromium in 1975, imports of ferrochromium established a record high. The published price of Soviet and Turkish chromite more than doubled at the beginning of the year, but the increase was not reflected by price increases of chromium alloys.

r Revised.

Legislation and Government Programs.—Government chromium material inventories are shown in table 2. Included in the inventories is material sold but unshipped. This includes chemical-grade chromite, 120,534 tons; refractory-grade chromite, 484,797 tons; and metallurgical-grade chromite, 671,813 tons.

During the year, no chromium material was available for sale from government stockpile excesses. Congressional authorization is required for disposal of these materials.

Deliveries of material from prior-year sales contracts included the following: Chemical-grade chromite, 83,379 tons; refractory-grade chromite, 97,862 tons; metallurgical-grade chromite, 236,744 tons; and chromium metal, 199 tons.

Early in the 94th Congressional session, a bill to amend the United Nations Participation Act of 1945, to halt the importation of Rhodesian chromium (in essence repeal of the Byrd amendment of 1971), was introduced in the House of Representatives. Considerable publicity was given by both those interested in reimposing chromium sanctions on Southern Rhodesia owing to political ramifications in Africa and those that believed reimposing sanctions would be harmful to the National Security. In September, the House voted against the bill thereby terminating the issue for the balance of the year.

In January, a petition was placed with the Department of the Treasury regarding alleged remuneration granted by the South African Government for manufacture or export of ferrochromium which constituted a violation under the Tariff Act of 1930, as amended. A preliminary finding in June reported that benefits had been received by manufacturers/exporters which, under certain circumstances, constitute payment of a bounty or grant, directly or indirectly. The South African Government agreed to discontinue power rebates, concessionary rail rates, and a finance charge aid scheme while manufacturers/exporters agreed to cease claiming an income tax reduction for certain export related expenses. At yearend, Treasury in a final determination found that no bounties or grants were being paid directly or indirectly within the meaning of the Tariff Act.

---

The Department of the Interior conducted an economic analysis of four critical materials including chromium. Supply/demand analysis, based on supply disruptions or cartel actions, resulted in a recommendation of a stockpile size of 1.2 million tons of contained chromium in various marketable forms proportional to the U.S. historical use patterns.[2]

PRODUCTION

Domestic mine production of chromite ceased in 1961 when the last Government Defense Production Act contract was phased out. However, the United States continued to be one of the world's leading chromite consumers in producing chromium alloys, refractories, and chemicals. The principal producers of these products were as follows:

Company	Plant
Metallurgical industry:	
Airco Alloys and Carbide Div., Air Reduction Co. Inc	Calvert City, Ky. Niagara Falls, N.Y. Charleston, S.C.
Chromium Mining & Smelting Corp	Woodstock, Tenn.
Foote Mineral Company	Keokuk, Iowa. Graham, W. Va.
Interlake, Inc	Beverly, Ohio.
Prairie Metals and Chemicals, Inc	Prairie, Miss.
Satralloy Corp	Steubenville, Ohio.
Shieldalloy Corp., Division of Metallurg Inc	Newfield, N.J.
Union Carbide Corp	Niagara Falls, N.Y. Marietta, Ohio. Alloy, W.Va.
Refractory industry:	
Basic Inc	Maple Grove, Ohio.
Corhart Refactories Co., Inc	Louisville, Ky. Pascagoula, Miss.
General Refractories Co	Baltimore, Md. Lehi, Utah.
Harbison-Walker Refractories (a division of Dresser Industries, Inc.)	Hammond, Ind. Baltimore, Md.
Kaiser Aluminum & Chemical Corp	Moss Landing, Calif. Columbiana, Ohio. Plymouth Meeting, Pa.
North American Refractories Co	Womelsdorf. Pa.
Ohio Fire Brick Co	Jackson, Ohio.
Chemical industry:	
Allied Chemical Corp	Baltimore, Md.
Diamond Shamrock Corp	Castle Haynes, N.C.
PPG Industries, Inc	Corpus Christi, Tex.

Table 3.—Production, shipments, and stocks of chromium ferroalloys and chromium metal
(Short tons)

Alloy	Production		Shipments	Producer stocks Dec. 31

[1] Includes chromium briquets, chromium metal, exothermic chromium additives, and other miscellaneous chromium alloys.

CONSUMPTION AND USES

Domestic consumption of 881,000 tons of chromite ore and concentrate containing about 256,000 tons of chromium was 39% below that of 1974. Of the total chromite consumed, the metallurgical industry used 60.4%; the refractory industry, 20.8%; and the chemical industry, 18.8%. The metallurgical industry consumed 532,000 tons of chromite containing 162,000 tons of chromium in producing 248,593 tons of chromium alloys and metal. About 55.3% of the metallurgical-grade ore had a chromium-to-iron ratio of 3:1 and over, 20.4% had a ratio between 2:1 and 3:1, and 24.3% had a ratio of less than 2:1.

Producers of chromite-bearing refractories consumed 183,000 tons of ore containing about 43,000 tons of chromium. The chemical industry consumed 166,000 tons of chromite containing about 51,000 tons of chromium in producing 122,000 tons of chromium chemicals (sodium bichromate equivalent).

Chromium has a wide range of applications in the three consuming industries. In the metallurgical industry, its principal use is in stainless steel. Stainless steel accounted for 61% of all chromium alloys consumed followed by full alloy steels (21%), high-strength low-alloy and electrical steels (5%), and carbon steels (2%). Total chromium alloy consumption decreased 42% from that of 1974.

The refractory industry utilizes chromium in the form of chromite primarily for the manufacture of refractory bricks to line metallurgical furnaces. Consumption of chromite for refractory purposes decreased 38% compared with that of 1974.

The chemical industry consumes chromite for manufacturing sodium and potassium bichromite, the base material for a wide range of chromium chemicals. Chromite consumption in this industry decreased 34% compared with that of 1974.

Strong demand for chromium in 1974 brought shortages of material essential to military systems. The impact of these shortages caused delays in development and production schedules and increased costs. In order to obtain a clear picture of shortages and primary causes thereof, the Department of Defense held a workshop on material shortages in January 1975. Since the United States relies on imports for its supply, chromium was a prominent topic of discussion.[3]

Basic nonfuel material requirements to the year 1990 to achieve the objectives of Project Independence were forecast.[4] A total of 279,000 tons of chromium was projected for use in equipment for fossil fuels recovery and processing; geothermal and hydroelectric plants; uranium mining, processing, and power generation plants using nuclear energy; solar energy systems; and electric power transmission and distribution. Most of the chromium requirement was for use in nuclear energy power generating facilities.

The U.S. Air Force conducted a workshop on chromium to identify and examine research and development options that might exist to conserve chromium in Air Force use. The workshop brought out that the Air Force is a low-volume user of chromium, but that use is strategically important. Most chromium usage was for aircraft engines, primarily as superalloys, and the cost of superalloys is relatively insensitive to price increases of chromium.[5]

STOCKS

Owing to weak chromium demand and a high level of imports in 1975, industry stocks of both chromite and chromium alloys increased substantially over those of 1974. Chromite stocks increased by 379,000 tons or 66%, while chromium alloy stocks increased 72,000 tons or 97%. Consumer chromium alloy stocks in general rose steadily throughout the year and more than tripled by yearend. Based on 1974 consumption, a strong demand year, chromite stocks in the metallurgical industry were sufficient for 9 months; for the chemical industry, nearly 5 months; and for the refractory industry, 6 months. Chromium alloys in the hands of producers and consumers totaled nearly 147,000 tons at yearend 1975, equivalent to a 3 months' supply at the 1974 consumption rate. A considerable tonnage of chromium alloys was in the hands of traders at yearend.

PRICES

Published prices of Turkish and Soviet chromite more than doubled at the beginning of the year. The price of Soviet chromite, which was quoted at $53 to $58 per metric ton, Black Sea ports for most of 1974, was quoted at $130 to $140 per ton in January and moved higher to $150 per ton in September. Turkish chromite, quoted at $65 per long ton Turkish ports in the last quarter of 1974, increased to $132 to $142 per ton late in January where it remained for the balance of the year.

South African Transvaal chromite, which was quoted at $47 to $52 per long ton Southern African ports in the latter part of 1974, decreased to $32.50 to $37.60 per ton at the beginning of the year. In August, the price was increased to $37 to $52 per ton for the balance of the year.

Owing to slack demand and high industry stocks, little price movement was visible for chromium alloys during the year despite the large price increases for Soviet and Turkish ores. The price for both U.S. and imported charge chromium decreased while U.S. high-carbon ferrochromium remained unchanged. The price spread for U.S. low-carbon (0.05% carbon) ferrochromium was narrowed, but the price of imported low-carbon ferrochromium decreased significantly. Prices of chromium alloys as published by Metals Week follow:

Material	*Cents per pound of chromium*	
	January	*December*
U.S. charge chromium	50	45–50
U.S. high-carbon ferrochromium	54–61	54–61
Imported charge chromium	65–75	44–50
U.S. low-carbon ferrochromium (0.05% carbon)	83–120	92–120
Imported low-carbon ferrochromium (0.05% carbon)	135–145	73–83
Simplex	85	92
	Cents per pound of product	
Aluminothermic chromium metal	280	244
Electrolytic chromium metal	280	244

FOREIGN TRADE

Exports of chromite reached a record high as some chromite from sales of government stockpile excesses moved into world trade. Reexports of chromite decreased 55% compared with that of 1974. Major export shipments were to Sweden (34%), the Netherlands (26%), Mexico (16%), Japan (8%), and Canada (8%). Smaller quantities were shipped to six other countries. Reexports were shipped to Mexico and Canada. Mexico received 72% of the shipments.

Ferrochromium exports to 22 countries increased 82% to 13,218 tons valued at $9,075,000. Canada (35%), the United Kingdom (15%), West Germany (13%), and Sweden and the Netherlands (9% each) were the leading recipients of the shipments.

Chromium and chromium alloys (wrought and unwrought) and waste and scrap exports totaled 703 tons valued at $1,227,000. Of the 33 countries receiving shipments, Argentina accounted for 27%; Canada, 21%; Jamaica, 16%; and West Germany, 9%.

Exports of pigment-grade chromium chemicals totaled 178 tons valued at $431,000. Canada (46%), Philippines (15%), the Republic of Korea (13%), and the United Kingdom (9%) received 83% of the shipments; the balance was dispersed among 13 other countries. Exports of nonpigment-grade chromium chemicals totaled 2,041 tons valued at $3,998,000. Taiwan received 27%; Canada, 25%; Japan, 10%; West Germany, 7%; and 27 countries received the balance.

Exports of sodium dichromate were nearly the same as in 1974 totaling 10,575 tons valued at $4,569,000. Canada received 33% of the shipments. Countries receiving over 1 million pounds, in decreasing order, were the Republic of Korea, Argentina, Romania, Egypt, and Colombia. Twenty-nine other countries also received shipments.

Imports of chromite in 1975 increased 14% in quantity and 113% in value compared with 1974 totals. Imports increased 17% from the U.S.S.R. and 92% from Southern Rhodesia.

Imports of ferrochromium were at an unprecedented rate totaling 318,809 tons, an increase of 96% over that of 1974. The Republic of South Africa and Japan supplied 40% and 29%, respectively, of the low-carbon ferrochromium imports. Ten other countries supplied the balance. High-carbon ferrochromium was imported from Southern Rhodesia (30%), the Republic of South Africa (29%), and Japan (26%). The balance was supplied by 12 other countries.

Ferrochromium-silicon imports decreased 83% to 4,136 tons valued at $2,041,000. Southern Rhodesia supplied 75%; the Republic of South Africa, 19%; and Taiwan, the balance of the shipments.

Imports of chromium metal, unwrought, and waste and scrap decreased to 1,629 tons valued at $6,630,000 from 1,960 tons valued at $5,388,000 in 1974. Of the six countries supplying imports, the United Kingdom accounted for 51%, and Japan, 46%.

Imports of chromium-containing pigments were as follows: Chrome green, 154 tons; chrome yellow, 2,473 tons; chromium oxide green, 384 tons; molybdenum orange, 235 tons; strontium chromate, 93 tons; and zinc yellow, 609 tons. Total value of these products was $4,327,000, down 51% from that of 1974. Of the total value, chrome yellow accounted for 56%, and zinc yellow, for 16%. The leading suppliers were Japan and Canada with 37% each of total value.

Imports of chromic acid totaled 344 tons valued at $323,000. Of the five countries supplying imports, Japan accounted for 61%; West Germany, 22%; and Poland, 16%.

Sodium chromate and dichromate imports totaled 796 tons valued at $398,000 down 59% in quantity and 65% in value from that of 1974. Of the three countries supplying imports, the U.S.S.R. accounted for 54%; Japan, 42%; and Hong Kong, the balance of the shipments.

Imports of potassium chromate and dichromate decreased to 61 tons from 456 tons reported in 1974. Total value of shipments was $24,622. Sweden accounted for nearly all of the shipments.

[2] Duty temporarily suspended on waste and scrap.

WORLD REVIEW

Albania.—Work was reportedly in progress on a ferrochromium plant at Burrel in the Mat district. This is the first such facility in Albania and was being constructed with Chinese assistance. Output of the plant will be used at the new Elfasan steel making complex.

Brazil.—Brazil's growing ferroalloy industry has been paced by increased production of silicon, columbium, and chromium ferroalloys. High-carbon ferrochromium production increased from 12,800 tons in 1972 to 35,200 tons in 1974. In addition, production of low-carbon ferrochromium and ferrochromium-silicon was initiated in 1974 as 2,200 tons of low-carbon ferrochromium and 1,900 tons of ferrochromium-silicon were produced.

Finland.—Airco, Inc., signed a 5-year contract for chromite supply specifying "floating quantities." The Finnish chromite will supply up to 75% of the ore needed for the firm's Vargon, Sweden, plant and some tonnage was to be shipped to other Airco plants.

Germany, West.—A chromite ore briquetting plant was being constructed near Duisburg harbor by Mineralhandels Gesellschaft Bouteiller. Reportedly, it will be the first commercial operation of its kind in Europe. Initial briquette production will be by cold bonding using a binder of 3% molasses and 2% to 3% hydrated lime. Cost of the new plant was estimated at $860,000.

Greece.—The Greek Minister for Industry approved prospecting permits for new chromite reserves. Target areas were Verria, near Kozani, and at the foot of Mount Olympus. If new reserves are found and developed, ore production would be for export in order to bolster the balance of trade.

India.—Occurrences, geology, reserves, and 1972 chromite production by individual producers was presented in a series of publications by the Geological Survey of India.[6]

Chromite reserves in India totaled 15.3 million tons. Of the total, 4.6 million tons are measured, 2.6 million tons are indicated, and 8.1 million tons are inferred. Of the measured reserves, 2.2 million tons are high-chromium of which 416,000 tons could be recoverable as lump material.

Jagdish Mines and Metals Pvt. Ltd. announced plans for production of 55,000 tons per year of chromite concentrate and pellets. Technology for the process was developed by the National Metallurgical Laboratory (NML). NML, however, recommended that the firm should export chromium alloys rather than concentrate.

Japan.—Looking toward improved business conditions, Tekkosha Co. Ltd. planned to expand its electrolytic chromium metal plant to 220 tons per month from 165 tons per month. The expansion was scheduled for completion in April 1976.

Nippon Denko Co. Ltd. completed installation of a new 28-megawatt furnace at its Hokuriku plant. The unit replaces two small furnaces and two 4.5-megawatt furnaces were placed on standby. The new unit was rated at 83,000 tons of ferrochromium per year.

Kenya.—A Kenyan company, Western Oil Co., which was carrying out exploratory work in conjunction with Oil Ventures International Inc. of the United States, reportedly discovered promising nickel and chromite deposits in the West Pokot area of Kenya. About 75% of Kenya's foreign exchange earnings are derived from minerals.

Malagasy Republic.—Early in 1975, Japanese ferrochromium producers reportedly established a new company, Madac, in preparation for exploration and development of chromite deposits in the Malagasy Republic. Efforts will be centered in the Adilamena-Tsaratanana district where chromite has been discovered. If developed, chromite output would be shipped to Japanese ferrochromium producers.

Pakistan.—Pakistan's only metallic mineral export was chromite. Production has declined from nearly 30,000 tons per year in the late 1960's to 11,000 tons in 1975. Reasons given for the decline are international competition combined with leasing and labor problems at privately operated mines. The 1980 chromite production target was set at nearly 80,000 tons.

Pakistan's ore reserves have been estimated at 2.6 million tons of chromite. The main deposits are located at Muslimbagh in Baluchistan. Other unproven chromite deposits are in the Northwest Frontier Province. The Baluchistan Development Authority, with assistance from West Germany, initiated an $800,000 feasibility study for a 16,000 ton annual capacity ferrochromium plant at Muslimbagh.

---

[6] Geological Survey of India. Geology and Mineral Resources of the States of India. Misc. Pub. No. 30. Part 2—Maharashtra, February 1974; Part 3—Orissa, February 1974; Part 4—Arunachal Pradesh Assam, Manipur, Meghalaya, Mizoram. Nagaland and Tripura, December 1974; Part 5—Bihar, February 1974; Part 6—Tamil Nadu and Pondicherry, May 1974; Part 8—Andhra Pradesh, May 1975.

Philippines.—Output of chromite decreased 2% compared with that of 1974; 23.5% was classified as metallurgical (high-chromium) ore and 76.5% as refractory (high-aluminum) ore. Acoje Mining Co. Inc., sole high-chromium chromite producer, reported 1974 reserves of 1.6 million tons. Consolidated Mines Inc., producer of chromite for refractory use, reported 1974 reserves of 7.9 million tons of chromite.

Rhodesia, Southern.—A description of the mining practices at the mines of African Chrome Mines Ltd., a subsidiary of Union Carbide Corp., was published.[7] The company operates an eluvial chromium ore mine at Impinge and 17 small underground mines in the Mtoroshanga area. For various economic, health and safety, and geologic reasons, mining practices have evolved that improved chromite recovery, reduced labor costs, and improved safety.

South Africa, Republic of.—Production of chromite in the Republic of South Africa totaled 2,288,000 tons, an increase of 11% compared with that of 1974. Of the total, 1,028,000 tons was classified as less than 44% Cr_2O_3; 1,243,000 tons from 44% to 48% Cr_2O_3; and 16,800 tons as over 48% Cr_2O_3. Local sales accounted for 613,000 tons and exports 997,000 tons. Local sales increased 71% while exports decreased 28% compared with those of 1974.

According to reports from Cape Town, South African chromite production will increase from 2.3 million tons in 1975 to 5.8 million tons in 1980. Also, it was expected that ferrochromium output would total 780,000 tons in 1980.

International Minerals & Chemical Corp. (IMC) entered into a feasibility study with Gold Fields of South Africa Ltd. and a subsidiary of Pechiney Ugine Kuhlmann of France for construction of charge ferrochromium plant with a capacity of 60,000 tons per year. A decision was expected near mid-1976; initial production would be in 1978. If built, Gold Fields would operate the plant with chromite ore being supplied by an IMC subsidiary.

Construction of Tubatse Ferrochrome (Pty) Ltd.'s ferrochromium plant at Steelpoort was reportedly begun in April. Tubatse is a joint venture of General Mining Corp. of South Africa and Union Carbide Corp. Startup of the facility was scheduled for late 1976. General Mining will supply the chromite ore requirements from its Eastern Transvaal mines.

Early in 1976, it was announced that N.C. Trading Co. Inc., a U.S. subsidiary of Imetal SA, would be the sales agent for chromium, manganese, and silicon alloys produced by South Africa's South American Minerals & Merchandising Corp. (Samancorp) and Africa Metals Corp. (Amcor).

Turkey.—According to the Turkish Chrome Producers Association, Turkey exported 663,056 tons of chromite during 1975, 25% more than that in 1974. The private sector accounted for 64% of the shipments; the public sector accounted for the balance. Over 51% of the shipments was from the port of Iskenderun. Shipments of ferrochromium decreased 20% to 6,993 tons from 8,695 tons in 1974.

U.S.S.R.—Of the total estimated Soviet chromite production, between 55% and 70% is exported per year; over 80% of this quantity is destined for Western countries. Of the estimated 850,000 tons domestically consumed in 1974, metal production accounted for 45%; refractories, 32%; and chemicals and other products, 23%.

About 94% of Soviet chromite reserves are located in Kazakhstan with the balance in the Ural Mountains. The Donskoye operation in Western Kazakhstan produces over 90% of the Soviet output and is the only supplier of high-quality ore. Chromite deposits in the Urals have a low Cr_2O_3 content as well as a low chromium-to-iron ratio and are used in the chemical and refractory industries. The first chromite concentrator in the U.S.S.R., with an annual capacity of 1 million tons, started production in 1974. The plant operates on low-grade ores that had been previously stockpiled.

Development of the first underground chromite mine continued at Donskoye. When completed in 1980, the mine reportedly will have a capacity of 2 million tons per year.

---

[7] Kimble, L. G. Mining Practice at African Chrome Mines. Chamber of Mines J. (Rhodesia), v. 17, No. 9, September 1975, pp. 35–43.

The U.S.S.R. asked for bids on various ferroalloy plants consisting of a 1-million-ton-per-year standard ferromanganese plant, a 320,000-ton-per-year ferrochromium plant, and a 60,000-ton-per-year silicon metal plant. The Soviets sought technical and financial assistance from United States ferroalloy producers and from companies in Europe. Financing was being sought from the Export-Import Bank and similar subsidy programs in Europe. Both Airco, Inc. and Union Carbide Corp. studied the proposals but no announcements were made. The target date for completion of the plants would be in 1980.

TECHNOLOGY

A new mining method was in the final stages of development at General Mining Corp.'s Zwartkop mine in northeastern Transvaal, South Africa. The new method involves longhole drilling, reduces waste haulage to virtually nothing, and significantly reduces labor requirements. Other advantages of the new method include increased face advance and production because of no waste removal, more favorable working conditions, and less expensive drilling costs, both in labor and materials.[8]

Bureau of Mines researchers reported on a process for recovering chromium, nickel, and iron values from stainless steel furnace flue dusts and other wastes generated during the manufacture of stainless steel.[9] Tests were conducted on flue dusts from industrial electric furnaces, mixtures of dusts, and mixtures of various plant wastes. Flue dusts were pelletized with coal breeze and smelted in coreless induction furnaces. The resulting ingots contained 49% to 67% iron, 14% to 19% chromium, 3% to 8% nickel, and small quantities of manganese and molybdenum.

From a laboratory research tool of a decade ago, electroslag remelting (ESR) of steels and superalloys slowly came of age. Estimates of ESR capacity range from 100,000 to 125,000 tons per year. Forecasts indicate capacity will double by 1980. Bethlehem Steel Corp. ordered the nation's largest unit to make ESR ingots up to 60 inches in diameter and weighing up to 75 tons. The electroslag remelting process produces higher quality steels with better workability and results in higher yields with less waste. ESR is used in production of high alloy steels for such applications as large forgings for the electrical industry, finishing rolls, and a broad range of tool and die steels. Many of the materials melted contain chromium.

Future energy needs according to many experts will depend on the development of the liquid metal fast breeder reactor. Before the fast breeder becomes a commercial reality, materials of construction must be tested. The Energy Research and Development Administration (ERDA) funded a study known as the national alloy development program to screen materials for use as cladding and duct material in the breeder's fuel assembly. Ten commercially available alloys have been selected for testing, all of which contain chromium. The materials will be exposed to ion bombardment at various facilities throughout the country and to neutron irradiation in the Experimental Breeder Reactor No. 2 in Idaho now under construction.

Various claims have been made in recent years on the benefit of up to 2% additions of chromium oxide (Cr_2O_3) on the compressive strength of portland cements. A study, from the manufacturers' viewpoint, indicated that while compressive strengths can be improved at 8 and 24 hours, the inclusion of Cr_2O_3 in the raw feed always reduces the 28-day values.[10]

National Aeronautics and Space Administration's Lewis Research Center in Cleveland discovered that black chromium plating, a coating used on cameras and to decorate furniture, was about 20% more efficient in retaining heat that other black materials. The discovery could lead to applications in solar heat collection devices.

A new commercial chromium plating process, based on trivalent chromium ions, was claimed by Albright and Wilson Corp. of the United Kingdom. Trademarked Alecra 3, the new system reportedly offers many advantages over conventional chromium plating methods: Elimination of toxic spray in the working environment, easier disposal of spent electrolyte, more uniform metal deposit, and automatic production of microcracked or microporous finishes.[11]

Corning Glass Works reportedly developed a plating chemical system for chromium and nickel with potential for reducing metal consumption by 50% to 90%. The system employs a climbing film evaporator that is attached to the first rinse tank thereby eliminating destruction or dumping of the accumulated plating chemicals.

Concern for the health of workers and others resulted in studies and investigations on the effects of exposure to chromium, particularly hexavalent chromium. In Japan, a high incidence of lung cancer was noted among workers involved in bichromate production. Also, from 1938 to 1971, hexavalent chromium slags have been dumped in or around Tokyo including landfill areas for schools and residential areas. As a result of this information, the Ministry of International Trade and Industry initiated a nationwide survey of chromate pollution. In the United States, the chromium pigments industry alerted its workers and customers to the possibility that prolonged inhalation of chromium pigments could cause lung cancer. The industry sponsored a study to determine the extent of the danger, if any. Two European studies indicated that excess exposure to dusts of chromium pigments could have a relationship with causation of lung cancer.

The Cobo process for pelletizing chromite ores, developed by the Royal Institute of Technology, was discussed.[12] A 20-ton-per-hour pelletizing plant installed by Ferrolegeringar AB at Trollhattan, Sweden, started operating in May. Startup problems were resolved by July. Early data indicates that operating costs total $5.08 per ton while labor represents a cost of $1.75 per ton.

Patent activity for chromium during the year concerned prereduction of chromite pellets in a rotary kiln,[13] refining of molten iron containing chromium,[14] and recovery of chromium and nickel from laterites.[15]

Clays

By Sarkis G. Ampian [1]

Clays in one or more of the classification categories (kaolin, ball clay, fire clay, bentonite, fuller's earth, or common clay and shale) were produced in 47 States and Puerto Rico. Clay production was not reported in Alaska, the District of Columbia, Rhode Island, or Vermont. The States leading in output were Georgia, 6.2 million tons; Texas, 4.2 million tons; and Ohio, 3.5 million tons; followed in order by North Carolina, California, and Wyoming. Georgia also led in total value of clay output with $195.3 million; Wyoming was second with $36.0 million. Compared with 1974 figures, clay production increased in 10 States and value increased in 16 States. Total quantity of clays sold or used by domestic producers in 1975 was 19% lower in tonnage, but rose about 1% in total value. The total value of clays produced was an alltime high. Increases in value per ton were reported for all clays in 1975 owing to increased labor, fuel, and material costs. The energy crisis or, more specifically, the increasing shortage and costs of fuels continued to cause considerable concern among clay producers and clay product manufacturers. Industrywide efforts were made to both economize and obtain standby fuels for their requirements. The costs of environmental protection equipment and environmental restrictions, and rising capital costs, combined with the energy crisis, continued to adversely affect production during 1975.

Production of the specialty clays—kaolin, ball clay, fire clay, bentonite, and fuller's earth—and common clay and shale, all decreased. A downturn in construction that lowered the demand for building materials (brick, lightweight aggregate, vitrified clay pipe, clay floor and wall tile, etc.) was responsible for the decline in production of common clay and shale. Production of both common clay and shale and fire clay decreased 21%, kaolin 17%, ball clay 14%, fuller's earth 3%, and bentonite 2%.

Kaolin in 1975 accounted for only 11% of the total clay production but for 51% of the domestic clay and shale value.

---

DOMESTIC PRODUCTION, PRICES, AND FOREIGN TRADE, BY TYPE OF CLAY

KAOLIN

Domestic production of kaolin in 1975 decreased 17%, and the value increased 4%. The average unit value for all grades of kaolin in 1975 was $40.53 per ton, $7.86 higher than in 1974. Kaolin was produced at mines in 14 States. Two States, Georgia (75%) and South Carolina (10%), accounted for 85% of the total U.S. production in 1975. California ranked third, Alabama fourth, and Missouri fifth. Output in 1975 increased in Arkansas, California, and Missouri, and declined in Alabama, Florida, Georgia, Minnesota, Nevada, North Carolina, Pennsylvania, South Carolina, Texas, and Utah. Idaho resumed production in 1975. No kaolin production was reported in 1975 for Colorado.

Kaolin is defined as a white, claylike material approximating the mineral kaolinite. It has a specific gravity of 2.6 and a fusion point of 1,785° C. The other kaolin-group minerals, such as halloysite and dickite, are encompassed.

During 1975 Freeport Kaolin Co., a division of Freeport Minerals Co., which mines and processes kaolin in Georgia, was constructing a 24-mile slurry pipeline from its new mining area near Sandersville, in Washington County, to its processing plant in Gordon. The new mines, complete with degritting facilities and the pipeline, were scheduled for completion by the middle of 1976. Engelhard Minerals and Chemicals Corp., also in Georgia, put a large high-gradient magnetic separator (HGMS) on line during the year, making a total of five operating magnetic separators in the kaolin industry.

Exports of kaolin, as reported by the U.S. Department of Commerce, increased from 849,000 tons valued at $42.1 million in 1974 to 880,000 tons valued at $47.9 million in 1975. The tonnage and value of the kaolin exported in 1975 increased 4% and 14% respectively, over that shipped in 1974. The unit value per ton increased $4.88. This increase in the unit value of kaolin exported was attributed to both the greater percentage of the higher quality paper-coating grades shipped and higher prices.

Kaolin was exported to 60 countries. The major recipients were Japan, 28%; West Germany, 17%; Canada, 16%; Brazil, 11%; and Italy, 10%; and the remaining countries, 18%. Exports increased, except for those to the Netherlands, Italy, the United Kingdom, Belgium-Luxembourg, Canada, Philippines, Sweden, and Mexico. The kaolin producers reported the end use for their exports as follows: Paper coating, 39%; paper filling, 13%; refractories, 38%; rubber, 4%; and others, including adhesives, ceramics, paint, and plastics, 6%.

Kaolin imports in 1975 increased slightly from 19,111 tons valued at $750,000 in 1974 to 19,126 tons valued at $773,000. The United Kingdom supplied nearly 96%; Canada, nearly 4%; and three other countries, less than 1%.

Kaolin prices quoted in the trade journals in 1975, except for fully calcined and air-floated, which advanced, and partially calcined, which was unavailable, were unchanged from 1974. Chemical Marketing Reporter, December 29, 1975, quoted prices as follows:

Waterwashed, fully calcined, bulk carload lots, f.o.b. Georgia, per ton	$120.00–$150.00
Paper-grade, uncalcined, same basis, per ton:	
No. 1 coating	53.00
No. 2 coating	43.00
No. 3 coating	42.00– 43.00
Filler, general purpose, same basis, per ton	27.00– 28.00
Delaminated, waterwashed, uncalcined, paint-grade, 1-micrometer average, same basis, per ton	91.00
Dry-ground, air-floated, soft, same basis, per ton	18.00
National Formulary, powder, 50-pound bags, 5,000-pound lots, works, per pound	.07
National Formulary, colloidal, 150-pound drums, works, per pound	.36

The average unit value reported by domestic kaolin producers was $40.53 per ton, an increase of $7.86 above the 1974 value.

BALL CLAY

Production and value reported for domestically mined ball clay in 1975 decreased 14% and 6%, respectively. Tennessee mines provided 60% of the Nation's output, followed in order of output by Kentucky, Mis-

sissippi, Texas, Maryland, New York,[2] California, and Arizona. Production in Arizona and Texas increased over that reported in 1974, but California, Kentucky, Maryland, Mississippi, New York, and Tennessee production decreased.

Ball clay is defined as a plastic, white-firing clay used principally for bonding in ceramic ware. The clays are of sedimentary origin and consist mainly of the clay mineral kaolinite and sericite micas.

In 1975, H. C. Spinks Clay Co., Inc.'s. newly completed drying and grinding facility at Gleason, Tenn., was fully operational. This facility expands production of air-floated and mechanically dried clays and eliminates costly hauling from its Gleason mines to other plants. NL Industries, Inc. announced formation of a Mineral Resources department to serve their ball clay, Edgar Plastic Kaolin, Wilson-Snead Bauxite, and Edgar Silica Products units.

The average unit value for ball clay reported by domestic producers rose in 1975 to $18.78 per ton, an increase of $1.44 per ton. Chemical Marketing Reporter, December 29, 1975, listed ball clay prices unchanged from 1974 as follows:

Domestic, air-floated, bags, carload lots, Tennessee, per ton	$18.00–$22.00
Domestic, crushed, moisture-repellent, bulk, carload lots, Tennessee, per ton	8.00– 11.25
Imported, air-floated, bags, carload lots, Atlantic ports, per ton	70.00
Imported, lump, bulk, Great Lakes, per ton	40.50

Ball clay exports in 1975 amounted to 156,000 tons valued at $3.5 million compared with 131,000 tons worth $2.9 million

---

[2] The famous Albany slip clay is included with ball clay solely for statistical convenience.

in 1974. Exports increased 19% over that shipped in 1974, but value increased 18%. The unit value of ball clay exported in 1975 declined $0.14 per ton, from $22.43 in 1974 to $22.29. These shipments were made to 18 countries. The major recipients were Canada, 58%, and Mexico, 38%. 16 countries accounted for the remaining 4%.

FIRE CLAY

Fire clay sold or used by domestic producers in 1975 was reported at 3,263,008 tons valued at $35.9 million. Fire clay is defined as detrital material, either plastic or rocklike, containing low percentages of iron oxide, lime, magnesia, and alkalies to enable the material to withstand temperatures of 1,500° C or higher. Fire clay is basically kaolinite but usually contains other materials such as diaspore, ball clay, bauxite clay, and shale. Fire clays commonly occur as underclay below coal seams and are generally used for refractories. Some fire clay was previously reported in other end uses.

Fire clay production was reported in 1975 from mines in 19 States. The first four States in rank, Missouri, Ohio, Pennsylvania, and Alabama, accounted for 82% of the total domestic output.

General Refractories Co., U.S. Refractories Div., began expandiing its Gary, Ind., plant to include a $2 million clay and alumina specialties plant. The new plant will have an annual capacity to produce in excess of 40,000 tons of mortars, plastics, and castables.[3] Louisville Fire Brick Works completed an expansion at its Garber, Ky., plant to be used for producing handmolded firebrick shapes. A fire in 1974 had badly curtailed production.

The Freeport Brick Co., Greenport, Pa. was constructing an entirely new automated plant for startup in early 1976.[4] The new

plant, expected to cost $3 million, will manufacture both pouring pit and a new line of refractories.

Exports of fire clay decreased from 224,000 tons worth $6.0 million in 1974, to 219,000 tons valued at $7.2 million in 1975. Fire clay exports decreased 2% in tonnage and rose 20% in value. The price of exported fire clay rose by $6.13 to $32.84 per ton.

Fire clay was exported to 46 countries, with Canada and Mexico receiving 45% and 40%, respectively. No imports of fire clay were reported during 1975.

There are no price quotations in domestic journals for fire clay, but the per-ton value reported by producers ranged from $2 to about $38. The reported average unit value for fire clay produced in the United States increased 11% from $9.92 per ton in 1974 to $11.01 in 1975.

BENTONITE

Bentonite production in 1975 decreased 2% in tonnage and increased 15% in value over that of 1974. A general decrease in domestic consumption, particularly in filtering decolorizing, foundry sand, waterproofing and sealing, and exports was noted along with a large increase in drilling mud and slight increases in animal feed and iron ore pelletizing.

Bentonite was produced in 12 States. Increased bentonite production was reported for California, Nevada, Oregon, Texas, and

Wyoming. Production decreased in Alabama, Arizona, Colorado, Mississippi, Montana, South Dakota, and Utah. No bentonite was reported for Missouri in 1975.

Generally, the high-swelling or sodium bentonites are produced chiefly in Wyoming, Montana, and South Dakota. The calcium or low-swelling bentonites are produced in the other States.

Industrywide improvements were made in environmental controls systems and in automating, bagging, and handling procedures. Some experimental work was also underway exploring the practicality of switching from oil and gas firing in dryers to coal burning.

On December 29, 1975, Chemical Marketing Reporter quoted bentonite prices unchanged. Domestic, 200-mesh, bags, carload lots, f.o.b. mines, was priced from $15.50 to $16.00 per ton; and imported Italian, white, high-gel, bags, 5-ton lots, ex-warehouse, $337.60 ($0.1688 per pound) per ton. The average unit value reported by

domestic producers for bentonite sold or used in 1975 was $15.63, an increase of $2.35 from the $13.28 average of 1974. Per-ton values reported in the various producing States ranged from $4 to $32 but, as in 1974, the average value reported by the larger producers was near the Wyoming average figure of $14.82.

Bentonite imports in 1975, including chemically activated material, totaled 5,219 tons valued at $617,000 compared with 3,639 tons valued at $699,000 in 1974. The 2,863 tons of chemically activated bentonite was imported from five countries, with Canada supplying 34%; Japan, 32%; Mexico, 31%; and West Germany and Italy, the re-

mainder. Special-purpose Italian bentonite was also imported in 1975.

Bentonite exports in 1975 decreased from 714,000 tons in 1974 to 697,000 tons in 1975; value increased from $28.1 million in 1974 to $39.5 million in 1975. Although the tonnage exported decreased 2% from that shipped in 1974, the value increased 40%. The increase in value was the result of a $17.19 increase in the unit value of exported bentonite, from $39.41 per ton in 1974 to $56.60 per ton in 1975. This increase in per-ton value was attributed to a large increase in the value of the higher cost drilling mud and foundry-grade bentonites shipped. Exports in previous years consisted of a larger percentage of the lower cost pelletizing grades. Domestic bentonite producers were facing increased competition in foreign markets. Bentonite from the Greek Island of Milos was being blended with the U.S. clay for pelletizing Canadian taconite ores on a large scale.

Bentonite was again exported to 83 countries. The major recipients were Canada, 44%; Australia and Peru, 8% each; the United Kingdom, 7%; West Germany and the Netherlands, 4% each; Japan, Saudi Arabia, and Singapore, 3% each; and the others, 16%. Domestic bentonite producers reported the end use of their exports were foundry sand, 37%; iron ore pelletizing, 32%; drilling mud, 29%; and others, including ceramics, mineral wool and insulation, soil conditioner, and waterproofing and sealing, 2%.

FULLER'S EARTH

Production of fuller's earth in 1975 decreased 3% in quantity and increased 18%

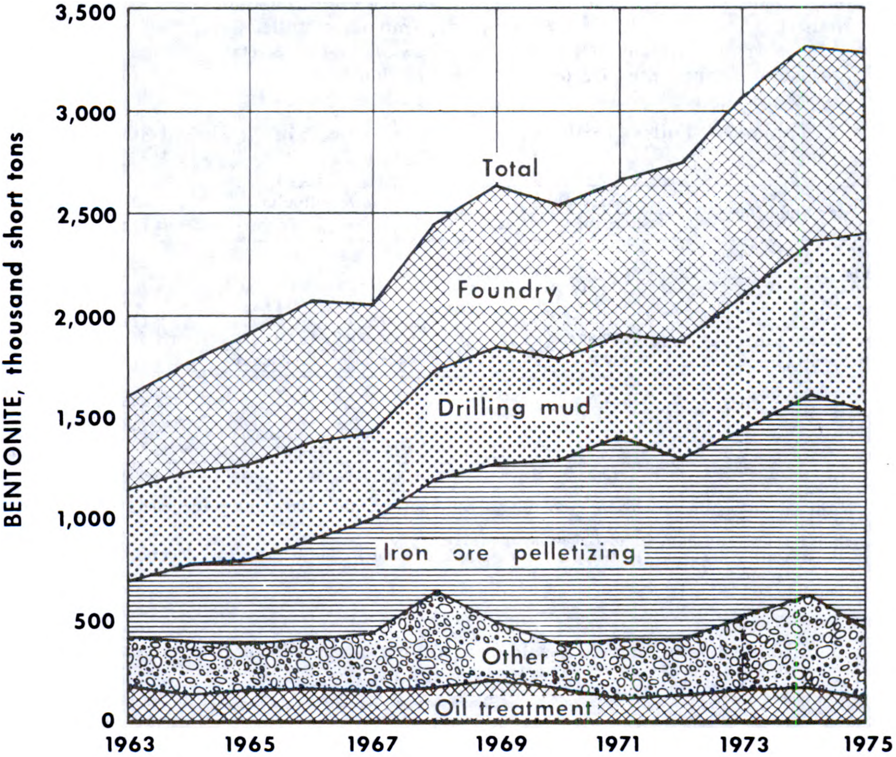

Figure 2.—Bentonite sold or used by domestic producers for specified uses.

in total value. The unit value assigned by domestic producers increased $6.29 in 1975 to $35.74 per ton. This increase in value was due to large increases in unit value by Florida, Illinois, Missouri, Tennessee, and Texas producers.

Fuller's earth production was reported from operations in nine States, a decrease of two from that of 1974. The two top producing States, Georgia (38%) and Florida (32%), accounted for 70% of the domestic production; the other seven States accounted for the remaining 30%. Illinois, Missouri, South Carolina, Tennessee, and Texas showed gains in production, but production in Florida, Georgia, and Mississippi declined. Utah's tonnage was unchanged. California and Nevada did not report any production in 1975.

Fuller's earth is defined as a nonplastic clay or claylike material, usually high in magnesia, which has adequate decolorizing and purifying properties.

Production from the region that includes Attapulgus (Decatur County), Ga., and Quincy (Gadsden County), Fla., is composed predominantly of the distinct lath-shaped amphibole clay mineral attapulgite. Most of the fuller's earth produced in the other areas of the United States contains varieties of montmorillonite.

Prices for fuller's earth were not publicly quoted in 1975, but the value per ton for attapulgite reported by producers ranged from $20 to over $70; montmorillonite prices ranged from $18 to $48.

Exports of fuller's earth to 38 countries decreased from 56,000 tons valued at $3.2 million in 1974 to 42,000 tons valued at $2.8 million in 1975. Export tonnage decreased 25%, and value decreased 12%. The unit value of exported fuller's earth rose

$9.91 per ton. The major recipients were the United Kingdom, 26%; Canada, 24%; the Netherlands, 12%; Belgium-Luxembourg, 10%; West Germany, 5%; France, Italy, Singapore, and the United Arab Emirates more than 2% each; and other countries, the remainder.

Imports of fuller's earth in 1975 were 65 tons, valued at $6,000, all from the United Kingdom.

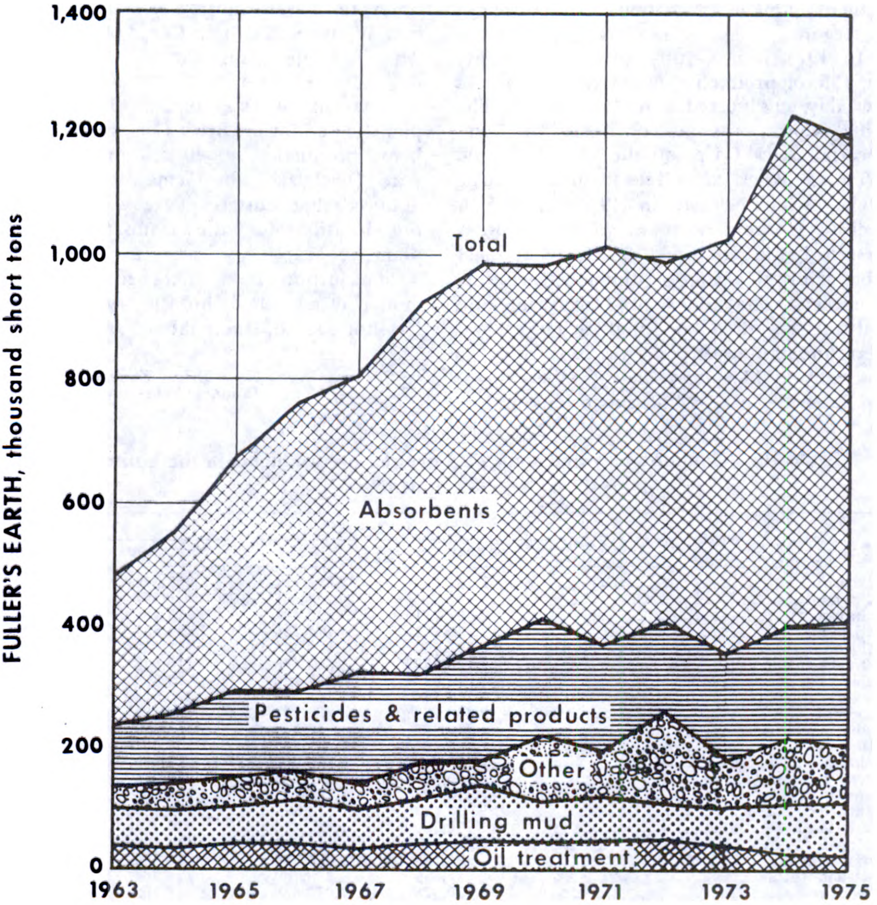

Figure 3.—Fuller's earth sold and used by domestic producers for specified uses.

COMMON CLAY

Domestic production of common clay and shale in 1975 totaled 35.3 million tons valued at $66.2 million. Common clay and shale represented 72% of the quantity and 16% of the value of the total clay and shale produced domestically in 1975. In addition, Puerto Rican production of common clay and shale was reported at 341,342 tons valued at $440,117. Domestic output in 1975 decreased 21% below that reported for 1974.

Common clays and shales are for the most part used by the producer in fabricating or manufacturing a product. Less than 10% of the total clay and shale output was sold. The average unit value for all common clay and shale produced in the United States and Puerto Rico in 1975 was $1.87 per short ton, $0.13 more than in 1974. The range in unit value reported for the bulk of the output was from $1 to $2 per ton.

Common clay is defined as a clay or claylike material which is sufficiently plastic to permit ready mold and vitrification below 1,100° C. Shale is a consolidated sedimentary rock composed chiefly of clay minerals that has been both laminated and indurated while buried under other sediments. These materials are used in the manufacture of structural clay products, such as brick and drain tile, portland cement clinker, and bloated lightweight aggregate.

In 1975, a new fully automated facility capable of producing 70,000 king-size bricks per day, engineered and designed by The Lingl Corp., was put onstream by Commercial Brick Corp. on the site of the old Wewoka Brick and Tile plant, Wewoka, Okla., which closed in 1973.[5] The new facility is the first plant in this country designed and equipped for total automation with all Lingl equipment including dehackers. The kiln is 18 brick wide and natural gas fired. A Lingl dehacker was also undergoing shakedown runs prior to assembly at Maryland Clay Products' plant in Beltsville, Md. Plant expansions and/or renovations were underway at one of General Wadsworth's Brick Corp. plants, at the American Olean Tile Co. plant in Quakertown, Pa., El Paso Brick Co. in Texas, and at Marion Brick's Bigler, Pennsylvania plant. The Marion Brick Co. expansion will boost production to 40 million brick per year. Officials of the Acme Brick Co. announced that Eustace, Tex., was chosen as the location for the company's newest plant.

The output of the energy-intensive common clay and shale industry was curtailed by shortages of fuel, labor, and a down-

[5] Ceramic Age. New Brick Facility Ready in '75. V. 91, No. 1, January–February 1975, pp. 1, 5.

turn in construction rates in 1975. Industrywide attention was focusing on coal firing as a possible escape from the high cost and shortages of oil and gas.

Exports of common clay and shale are not tallied by the U.S. Department of Commerce. Most countries have local deposits of either clays or shales that are adequate for manufacturing structural clay products, cement clinker, and lightweight aggregates, and thus have no need to import such materials.

CONSUMPTION AND USES

The manufacture of heavy clay products (building brick, sewer pipe, drain, roofing, structural, terra cotta, and other tile), portland cement and clinker, and lightweight aggregate accounted for 36%, 20%, and 16%, respectively, of the total 1975 domestic consumption of clays. In summary, 72% of all clay produced in 1975 was consumed in the manufacture of these clay- and shale-based construction materials. The foregoing clay tonnage relationships were similar to those reported for 1974. The utilization of clays in 1975 for heavy clay products and portland cement decreased 24% and 18%, respectively, over that reported in 1974.

Heavy Clay Products.—The values reported for shipments of heavy clay products in 1975 declined 6% to $656 million from the 1974 value of $695 million. The trends in corresponding quantities were less consistent. Thousand-unit counts for building or common face brick decreased 12% in 1975 from that shipped in 1974, shipments of glazed and unglazed ceramic tile and glazed brick, and of clay floor and wall tile decreased 19% and 14%, respectively. The tonnage of unglazed structural tile decreased 12%, and vitrified clay sewer pipe and fittings shipped during the year declined 18%. The value of these shipments except for structural tile was unchanged from 1974, declined 5% each for building brick and clay and floor and wall tile, 7% for clay sewer-pipe, and 15% for ceramic tile.

Lightweight Aggregate.—Consumption of clay and shale in the making of lightweight aggregate declined in 1975 to 8,138,889 tons. This was a 19% decrease from the 10.0 million tons used in 1974.

The tonnage of raw material mentioned in tables 20 and 23 for lightweight aggregate production refers only to clay and shale and does not include the quantity of slate and blast furnace slag similarly used. In 1975, 510,000 tons of slate was expanded for lightweight aggregate, 48% below the 1974 figure of 983,196 tons. The National Slag Association reported the amount of slag used for lightweight concrete aggregate and in block manufacture decreased 17%, from 1,316,000 tons in 1974 to 1,092,000 tons in 1975.

Refractories.—All types of clay were used in manufacturing refractories. Fire clay, bentonites, and kaolin accounted for 66%, 16%, and 12%, respectively, of the total clays used for this purpose. Bentonite was used primarily as a bonding agent in proprietary foundry formulations. Minor tonnages of ball clay (4%), fuller's earth, and common clay and shale (the remaining 2%) were also used, primarily as bonding agents.

The tonnage used for refractories in 1975 increased to slightly more than 9% of the total clays produced. This slight increase in the use of clay-based refractories continued for a fourth year, a reversal in the downward pattern set for a number of years. The increase was due primarily to both the continued expansion in refractory aggregate production and an upsurge in the manufacturing of more conventional brick-type refractories. Refractory aggregates are used mostly in plastic, gunning, ramming, and castable mixes.

Filler.—All clays are used to some extent as fillers in one or more areas of use. Kaolin, fuller's earth, and bentonite are the principal filler clays. Kaolin was used in the manufacture of a large number of products, such as paper, rubber, plastics, paint, and fertilizers. Fuller's earth was used primarily in pesticides and fertilizers. Clays in pesticides and fertilizers are used either as carriers, diluents, or prilling agents. Bentonites were used mainly in animal feed.

Six percent of the clay produced in 1975 was used in filler applications. Of all the clay used for these purposes, kaolin accounted for 85%, fuller's earth 8%, and bentonite 6%. Ball clay and common clay and shale accounted for the remainder. The total amount of kaolin consumed by this end use category decreased 17%. In the individual kaolin categories, increases were recorded in adhesives (34%), paper coating (10%), and pesticides (13%). Decreases were noted in fertilizers (40%), paint (56%), paper filling (40%), plastics (15%), and rubber (25%). Total quantity of fuller's earth used in insecticides and fungicides increased 10%.

Absorbent Uses.—Absorbent uses for for clays, 753,651 tons, consumed nearly 2% of the total 1975 clay production. Demand for absorbents in 1975 decreased 4% from that reported for 1974. Fuller's earth was the principal clay used in absorbent applications; 96% of the entire output was consumed for this purpose. Bentonite was used to a lesser degree. Demand for clays in pet absorbent, representing 54% of the 1975 absorbent demand, increased 11% from that reported for 1974. Demand for use in floor absorbents, chiefly to absorb hazardous oily substances, represented the remaining 46% of absorbent demand and decreased 18% from the 1974 figure.

Drilling Mud.—Demand for clays in rotary-drilling muds increased 21% in 1975, from 681,755 tons in 1974 to 827,962 tons. This increase in demand, mostly in exploratory gas well drilling and to a lesser degree in oil well drilling, was spurred by the deregulation of "new" gas introduced into the interstate market after April 6, 1972. Drilling muds consumed nearly 2% of the entire 1975 clay production. Swelling-type bentonite is the principal clay used in drilling-mud mixes, although fuller's earth or nonswelling bentonite is also used to a limited extent. Bentonite and fuller's earth accounted for nearly 100% of the total amount of clay used for this purpose. Small amounts of ball clay and common clay and shale were used in specialized formulations.

Floor and Wall Tile.—Common clay and shale, ball clay, fire clay, kaolin, and bentonite, in order of demand, were used in manufacturing floor, wall, and quarry tile. This tile end use category accounted for less than 1% of the total clay production in 1975. Demand in 1975, 398,707 tons, decreased 16% from that shown in 1974.

Pelletizing Iron Ore.—Bentonite is used as a binder in forming iron ore pellets. Demand, continuing the general trend, increased slightly in 1975 to 878,022 tons. This rise in the use of bentonite for iron ore pelletizing, reflecting an upturn in steel production, was accomplished in spite of inroads made by cheaper foreign bentonites into a traditional U.S. clay market. Of the total bentonite produced in 1975, about 32% of the swelling variety (as in 1974) was consumed for this purpose. U.S. deposits continued to be the major source for swelling bentonites.

Pottery.—The total demand for clays in the manufacture of pottery, sanitary ware, china/dinnerware, and related products, excluding clay flower pots, accounted for about 1% of the total 1975 clay output. The total clay demand, principally ball and kaolin clays, declined from approximately 752,000 tons in 1974 to approximately 616,000 tons in 1975.

NONCLAY REFRACTORIES					
Silica brick and shapes	1,000 9-inch equivalent	37,626	20,004	37,478	29,376
Magnesite and magnesite-chrome brick and shapes	do	117,209	178,840	79,245	152,060
Chrome and chrome magnesite brick and shapes	do	20,726	30,536	13,890	25,148
Shaped refractories containing natural graphite	Short tons	22,561	23,863	19,196	21,752
Other carbon refractories: Forsterite, pyrophyllite, dolomite, dolomite-magnesite, molten-cast [5] and other brick and shapes	1,000 9-inch equivalent	40,418	97,085	21,759	64,710
Other mullite, kyanite, sillimanite, or andalusite brick and shapes	do	6,239	14,253	4,273	12,642
Other extra-high (over 60%) alumina brick and fused bauxite, fused alumina, dense-sintered alumina shapes [6]	do	4,148	16,475	3,738	20,142
Silicon carbide brick, shape, kiln furniture	do	5,272	25,644	4,522	24,975
Zircon and zirconia brick and shapes	do	2,703	11,380	2,121	16,736
Refractory bonding mortar	Short tons	60,250	12,245	37,190	9,182
Hydraulic-setting nonclay refractory castables	do	47,406	14,656	40,071	16,329
Plastic refractories and ramming mixes	do	233,833	48,737	171,648	43,732
Gunning mixes	do	422,104	55,624	311,366	53,510
Dead-burned magnesia or magnesite [3] [7]	do	[r] 330,490	[r] 38,342	551,108	85,211
Other nonclay refractory material sold in lump or ground form [3]	do	473,006	18,277	432,265	20,359
Total nonclay refractories		XX	[r] 605,961	XX	595,864
Grand total refractories		XX	[r] 1,016,114	XX	1,005,743

[r] Revised. NA Not available. XX Not applicable.

[1] Heated short of fusion; volatile materials thus being driven off in the presence of chemical changes, giving more stable material for refractory use.

[2] More or less plastic brick and materials which after the addition of any water needed, are rammed into place.

[3] Materials for domestic use as finished refractories, and all exported material.

[4] Including calcined clay, ground brick and siliceous and other gunning mixes.

[5] Molten cast refractories are made by fusing refractory oxides and pouring the molten material into molds to form finished shapes.

[6] Completely melted and cooled, then crushed and graded for use in a refractory.

[7] Includes shipments to refractory producers for reprocessing in the manufacture of other refractories.

WORLD REVIEW

Australia.—Preliminary investigations of reportedly high-grade kaolin deposits were reported by Western Titanium Ltd.[6] In another kaolin development, the English China Clays Co. (ECC) announced that its new filler plant in the Melbourne area was operating successfully at full capacity.[7] To date, coating-grade kaolin was not produced in Australia.

Bolivia.—An unspecified halloysite deposit was being evaluated for potential use in manufacturing refractory bricks and ceramics.

Brazil.—The J. M. Huber Corp. (JMH) formed a joint venture, Caulim Do Para, with Construtora Mendes Junior S.A. (5%) to beneficiate Huber's large, high-quality kaolin deposits in the State of Pará. A processing plant, similar to JMH plants in Georgia, with an initial capacity of 280,000 tons per year of paper coating and filler clays was contemplated.[8]

Bulgaria.—Kaiser Engineers International Inc. was retained by the Ministry of Mineral Resources to work on technical and economic studies designed to evaluate indigenous oil shales and nonbauxitic resources for a possible alumina-aluminum industry in Bulgaria.[9]

Burundi.—The United Nations Industrial Development Organization (UNIDO) sanctioned building an insecticide plant that would use kaolin mined in the Kayanza region, about 50 miles from Bujumbura, as a carrier.[10] Half of the plant's annual capacity, 2,225 tons of pesticide, was designated for the neighboring countries, Rwanda and Zaire, to protect their coffee and cotton plantations.

Canada.—Employees of the Canadian Refractory Division of Dresser Industries Canada Ltd. purchased their company's refractories, construction, and building brick businesses in British Columbia. The employees planned to operate under the name Clayburn Refractories Ltd.[11] General Refractories' Smithfield magnesite and chrome refractory brick plant in Ontario was planning a new manufacturing facility for high-alumina firebricks and bulk products.[12] Thunder Brick Co. awarded a contract to The Lingl Corp. to build a combined face brick and tile plant on the site of the former Rosslyn Brick Works in Thunder Bay, Ontario. Design capacity of the plant was 54,800 modular brick per day.[13]

France.—Pechiney Ugine Kuhlmann (PUK) concluded an agreement with Alcan Aluminum Ltd. to develop a sulfuric-hydrochloric acid process for recovering alumina from nonbauxitic raw materials, such as clays.[14]

Guyana.—A new brick plant, located on 30-acre site with accompanying mill buildings, was under construction in Georgetown.[15]

Indonesia.—The State tin-mining enterprise P. N. Timah continued exploration and testing on the tin islands Bangka, Belitung, Singkep, and Bangkinang, for new clay and kaolin deposits. Clays are currently being mined for the domestic ceramic industries by a number of small enterprises.[16]

Italy.—Production of activated bentonite at Sud-Chemie's new plant at Giba, Sardinia, after trial runs in 1974, was at its operating capacity of 100,000 to 120,000 tons per year.[17]

Pakistan.—An estimated 100 million tons of fire clay and 160,000 tons of china clay supply domestic industry and provide expansion potential. The china clay is used mostly in manufacturing ceramic products and the fire clay in firebricks.[18]

Saudi Arabia.—An $8.5 million contract was awarded to Swindell-Dressler Co., a division of Pullman, Inc., by the Saudi Red Brick Co. of Jiddah, to design, engineer, and supervise construction of a major ceramic building materials complex.[19]

South Africa, Republic of.—Recent changes in the structure and ownership of the G and W Group of companies have resulted in the emergence of Zimro (Pty.) Ltd. as a company owned by Anglo-American Corp. G and W was the country's largest producer of bentonite and kaolin.[20] The new company Zimro also includes Luzinada Umbeluzi Mina Lda., an important Mozambique bentonite producer. English Clays South Africa (Pty.) Ltd., a subsidiary of ECC, and recently installed in Pretoria, has acquired control of some local flint (fireclay) deposits.[21] The company was exploring the possibility of upgrading clays and related minerals for both local consumption and export. Plans were also announced for a pilot plant to produce chamotte (refractory grog and crude aggregates) for the refractories market.

Sweden.—Sala International AB, a member of the Boliden Group, and JMH have entered into an agreement under which Sala will act as exclusive licensing agent outside the United States for Huber's expertise on the application of magnetic separation to the beneficiation of clays and other related materials.[22]

Tanzania.—Plans were outlined for developing a kaolin industry to meet the re-

e Estimate. p Preliminary. r Revised.

[1] In addition to the countries listed, the People's Republic of China, East Germany, Lebanon, Nigeria, South Vietnam, Southern Rhodesia and Yugoslavia also produced kaolin, but information is inadequate to make reliable estimates of output levels. Costa Rica, Guatemala, Morocco, and Mozambique each produced less than 500 tons in each of the years covered by this table.

[2] Kaolin sold or used by producers.

[3] Includes kaolinitic clay.

[4] Excludes unwashed kaolin as follows, in thousand short tons: 1973–84; 1974–84 (estimated); 1975–51.

[5] Less than ½ unit.

[6] Data given are for ceramic and pottery clays.

quirements of the domestic paper, glass, and ceramic industries.[23]

Turkey.—Plans for a plant in Kahramanras with an annual capacity of 20 million brick and 5 million tiles was reported by Martug Tugla Ve Kiremit A.S.[24]

United Kingdom.—The Canterbury-based Robert Brett group of companies applied for permission to work the calcium montmorillonite deposits at Baulking in Berkshire.[25] The Baulking deposit and the nearby deposit at Fernham were outlined by the Institute of Geological Sciences in the late sixties.

Hepworth Ceramic Holdings, Ltd., built two tunnel kilns with commissioning scheduled for 1976, and entered the European Market by purchasing an unnamed Belgian company. Watts, Blake and Bearne and Co., Ltd., which has china and ball clay operations, mainly in Devon, completed its new ball clay processing plant. The plant became fully operational during the year with a record of over 500,000 tons of ball clay.[26] ECC commissioned a new refining, drying, and calcining plant in Cornwall.[27]

Yugoslavia.—Current expansion of the Karacevo kaolin mine near Kosovska Kamenica, when completed by 1978, should increase production capacity to 70,000 tons per year. Reserves of the deposit were 3.5 million tons.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, France, Iran, Japan, and Turkey have reportedly produced fuller's earth in the past and may continue to do so, but output is not reported and available information is inadequate to make reliable estimates of output levels. Similarly, no information is available on output in the centrally planned economy countries of Europe and Asia, but at least some of them also are presumably producing fuller's earth.

[2] Revised to zero.

TECHNOLOGY

The Federal Bureau of Mines and nine companies (one more than in 1974)—eight aluminum producers and a refractory manufacturer—continued cosponsoring research on extracting alumina from domestic materials that are plentiful, which could ease our dependence on imported metallurgical- and refractory-grade bauxite. Using minipilot-plant facilities at the Boulder City (Nevada) Metallurgy Laboratory, researchers were investigating several methods for extracting alumina from clays, anorthosite, alunite, and dawsonite-bearing oil shales. Each participating company was contributing $50,000 annually, with the cost to the Bureau in excess of $500,000 annually.

The clay/nitric acid miniplant, the first acid process studied, using calcined kaolin was successfully completed and placed on a standby basis. Only minor laboratory wrapup efforts were being conducted on this process. The miniplant study showed that with four stages of countercurrent decantation, over 90% of the alumina was recoverable. Current work was being devoted to the design, construction, and operation of a kaolin clay/hydrochloric acid miniplant. This miniplant has already been operated for three integrated campaigns, each time with more of the equipment in place. Preliminary data show recoveries of 95% of the acid-soluble alumina during leaching. The complex problem of $AlCl_3.6H_2O$ crystallization was responding favorably to HCl gas sparging; chloride decomposition to alumina, another problem area, was amenable to a roasting technique. A lime-sinter process to recover alumina from anorthosite was derived from the literature. The process features sintering finely ground and thoroughly mixed anorthosite and limestone to produce a self-disintegrating (dusting of δ-dicalcium silicate) mixture of dicalcium silicates and calcium aluminates. The alumina is leached from the mixture with sodium carbonate solutions and the alumina precipitated by carbonation. Equipment flowsheets have been prepared with the equipment sized to produce 20 pounds of alumina per hour. Construction of the anorthosite miniplant was underway.

In another effort, the Bureau was exploring the feasibility of chlorinating clays and other domestic aluminiferous materials directly and for purifying this crude aluminum chloride to electrolytic grade. Current technology employs a high-purity anhydrous chloride in a fused-salt electrolytic cell. This Bureau purification research, if successful, would allow continuous removal of iron immediately prior to the electrolytic reduction to aluminum metal thereby permitting a wide variation in the iron contamination of the crude $AlCl_3$ feed.[28]

---

[28] U.S. Bureau of Mines. "Purification of Crude Aluminum Chloride By Fused-Salt Flutrolysis. Mineral Research and Data Analysis Highlights, v. 1, No. 9, May 1975, p. 6.

In related clay work, as a part of the Bureau's program to broaden utilization of abundant low-quality mineral material, beneficiation studies were conducted on two Alabama clays, an underclay and a kaolin. Results showed that by a combination of attrition grinding and sodium dithionite leaching to remove iron contamination, the underclay could be upgraded to a ball clay material. The kaolin, cone 04 or 1,050° C whiteness of 89, responding favorably to a pH adjustment to approximately 9 by sodium carbonate addition, appeared to be an excellent ball clay substitute.[29]

Other alternative methods of producing alumina from clays were patented during the year. In one patent, the finely divided ore is digested in hot concentrated sulfuric acid and subsequently treated with aqueous hydrochloric acid to precipitate hydrated aluminum chloride.[30] The aluminum chloride is further processed to recover both alumina and liberate hydrochloric acid for recycling.

Another patent outlines a nitric acid method for recovering the alumina values from clays.[31] In this technique, the clays are leached to produce an impure aluminum nitrate solution, which is then contacted with an ion-exchange liquid to remove the iron and further treated to yield a cell-grade alumina. In another chloride-forming process, the claylike material is dehydrated, coked, and contacted at 700° to 1,000° C with a gaseous stream of chlorine and carbon monoxide to evolve aluminum trichloride suitable for use either in producing metal or chemicals by conventional means.[32] In a nonacid method patented, the clay or any other aluminosilicate is upgraded, agglomerated and reduced carbothermically in an electric furnace to produce an aluminum-silicon alloy, which is then separated, comminuted, and then hydroaluminized using an olefin, hydrogen, and a catalyst to recover a material that is eventually pyrolyzed to an aluminum powder.[33]

A review highlighted the past, present, and future of high-intensity, high-gradient wet magnetic separation (HGMS).[34] This review also traced the historical evolution of HGMS designs and depicted some of the currently available commercial separators. This work, while highlighting the removal of contaminants from mineral and chemical industries, also stressed its role in environmental protection and water purification. A comment on role of the kaolin industry in HGMS progress and the companies, which together have fabricated and installed most of large units, was advanced.[35]

The importance of organic-coated industrial minerals, such as bentonites and fuller's earths, and the many industries in the United Kingdom using these materials was reviewed.[36] The technology of property modification brought about by the coatings, and their applications in the paint, rubber, and plastic industries, in lubricants, in the fertilizer industry (as anticaking agents), were also discussed. A similar, but more detailed, work was published on the role of clays and other inorganic materials in paint manufacturing.[37]

The two techniques developed for using bentonite in making low-cost retaining walls was discussed.[38] One method used alternating piles of concrete and hardened bentonite to build a 33-foot-deep wall to cut off ground water. The other method suspended precast panels in the bentonite, then exposed them by excavating after the slurry was gelled with additives. An added advantage of these techniques is the absence of noise and vibration that accompanies the pile-driving methods.

A detailed discussion of the industrial mineral deposits of Wyoming, Utah, Idaho, and Montana was published.[39] The Wyoming swelling bentonite deposits, the producers and their flowsheets, their markets, present and future, reclamation techniques, and outlook were singled for a comprehensive treatment. Another work discusses the Giba Sardinian bentonite deposits and presents a flowsheet showing sodium-exchange, drying, classifying, and grinding procedures.[40] A brief résumé of the materials in Manitoba, Canada, available for heavy-clay products, their properties, and products made from them were summarized along with a brief history of the area's clay industry.[41] A discussion of a flowsheet for producing filler-quality kaolin from the Ione deposit, its northwest paper mill markets, and transportation problems were outlined in a concise work.[42]

The adsorption of the water-soluble fraction of poultry litter was investigated using selected soils, kaolins, and bentonites, as adsorbants.[43] Results indicated that the litter was adsorbed similarly by either the soils or the clays, but the rate of adsorption was faster with bentonites. The application of these adsorbed clays with their organic matter as a soil amendment would go a long way in eliminating a sanitary disposal and/or pollution problem while providing a valuable source of plant nutrients. Another study directed toward using kaolins and montmorillonite clays to preferentially remove contaminating industrial dyes from textile discharge wastes was published.[44] Research revealed that both types of clays were effective in removing the objectionable dyes from the discharge waters.

A detailed discussion of modern refractory maintenance procedures for vertical and rotary lime kilns was highlighted.[45] The discussion included sections on refractory selection, availability, and support equipment required for relining. In addition, the forms of the commonly available refractories, brick, castables, plastic, ramming mixes, and mortar, and the analysis of service conditions in both types of kilns were also detailed. A process involving a very low heat requirement—only 1,200 Btu per pound for the entire fabrication—was outlined for producing expanded lightweight clay aggregates.[46]

DOMESTIC PRODUCTION

In 1975, production of bituminous coal and lignite reached an alltime high of 648.4 million tons, a 7.5% increase over the 603.4 million tons produced in 1974. The previous record production year was 1947 when production was 630.6 million tons. Despite the record output, bituminous coal and lignite consumption increased less than 4 million tons. Essentially all of the increase in production went into replenishing stockpiles which had been drawn upon heavily during the coal miners' strike in the fourth quarter of 1974, and to meet increased demands for export coal. The slowdown in the economy, particularly in the first half of 1975 resulted in only a nominal increase in electric utility coal consumption and a decline in coal requirements by steel companies.

In 1975, there were 6,168 bituminous coal and lignite mines operating in 26 States located in Appalachia, the Midwest, and the Mountain and Pacific regions. The leading coal producing States in order of output were Kentucky, West Virginia, Pennsylvania, Illinois, Ohio, and Virginia. Combined, they accounted for 74% of total U.S. production. Underground production increased about 16 million tons in 1975, while production from surface mines increased 30 million tons and accounted for 55% of total coal output.

The data in this chapter include all bituminous coal produced in the United States except that from mines producing

[2] Interstate Commerce Commission.

less than 1,000 tons per year. All quantity figures represent net tons of marketable coal and excludes washery and other refuse. Statistics are final and based upon detailed annual reports of production and mine operation furnished by producers. For production not directly reported (chiefly that of small mines), data were obtained from the records of State mine departments, which have statutory authority to require such reports. Thus, complete coverage of all mines producing 1,000 tons a year or more is reported.

The weekly and monthly estimates of production, summarized in tables 6–7, are based upon railroad carloadings of coal reported weekly by railroads, river shipments reported by the U.S. Army Corps of Engineers, reports from mining companies, and monthly production statements compiled by local operators associations and State mine departments.

There were approximately 23,000 more men mining bituminous coal and lignite in 1975 compared with 1974. The total number of production workers increased from 167,000 to nearly 190,000. Productivity at surface mines declined from 33.16 tons per man per day to 26.69 tons per man per day. The average productivity at all mines declined from 17.58 tons per man per day in 1974 to 14.74 tons in 1975.

CONSUMPTION AND DISTRIBUTION

Tables 42–45 summarize shipments of coal and lignite in 1975. Table 45 shows the quantitative changes in total tons by geographic division and States of destination from 1971 through 1975. The distribution data by consumer use does not necessarily conform to the consumption data because the latter represents actual use at consumer's facilities, whereas the distribution data represented shipments from the mines, some of which were in transit or in consumers' storage. These distribution data are based on reports submitted quarterly to the Bureau of Mines by producers, sales agents, distributors, and wholesalers, who normally produce or sell 100,000 tons or more annually. Their reported tonnage accounted for 93% of coal shipments, estimates for the remaining shipments, are included, based on data from the Federal Power Commission and other reliable coal statistical reporting agencies. Additional details of bituminous coal and lignite distribution are presented in a Bureau of Mines report.[3]

PRICES

The average mine price of bituminous coal and lignite increased from $15.75 per ton in 1974 to $19.23 per ton in 1975. The average price of coal produced at underground mines increased from $19.86 per ton to $26.28 per ton. The average price coal shipped from surface mines increased from $12.25 per ton to $13.44 per ton. The average rail freight charge on coal increased from $4.71 per ton in 1974 to $5.23 per ton in 1975.

FOREIGN TRADE

In 1975, the United States exported 65.7 million tons of bituminous coal, an increase of about 6 million tons compared with exports in 1974. Japan maintained its position as the principal U.S. foreign market with a 38.8% share of total U.S. coal exports. Shipments of coal to Canada, Europe, and South America accounted for 26.3%, 28.9% and 5.0% respectively.

TECHNOLOGY

In recent years, research has been primarily on improvement in coal mining methods and efficiency rather than innovation. In underground mining, current coal mining technology is characterized by a variety of specially designed mechanical cutting and loading devices, such as mobile loading machines, continuous-mining machines, and longwall equipment. Continuous-mining machines replaced the mobile loaders at many locations and in 1975, continuous-mining machines cut and loaded nearly two-thirds of total underground production.

The rapid rate of coal extraction by continuous mining makes it imperative that haulage be coordinated to the fullest extent possible with extraction and loading operations. Short supplemental belt conveyor systems, which move coal from continuous-mining machines to the main haulage system without shuttle cars, are being used extensively to approach this objective. Considerable improvements are still necessary in underground haulage if transportation systems are to keep pace with the high productivity of continuous-mining machines, which often have to halt operations while transportation facilities handle the coal already cut from the face.

Research on the best way to control respirable dust continued with the introduction in 1975 of several new collection and spray systems, foams, and wetting agents. New bits and cutting systems also promise to reduce dust production.

Two systems for determining the locations of miners trapped by cave-ins, fires, or explosions were introduced. One was based on the detection on the surface of seismic vibrations caused by a miner hammering on a roof bolt. The system is limited to vertical distances of 700 to 800 feet, and up to a 1,000-foot horizontal distance. The other system comprises a small radio transmitter powered by a cap lamp battery, a transmitting antenna that the miner deploys in a circular pattern, a helicopter-mounted receiver that is flown in a controlled grid over the mine area, and ground receivers for locating the trapped men.

---

[3] Bureau of Mines. Bituminous Coal and Lignite Distribution for Calendar Year 1975. Mineral Industry Surveys, Apr. 12, 1976, pp. 51.

Underground lighting received considerable attention in 1975 in response to regulations proposed by the Mining Enforcement and Safety Administration (MESA). New lighting techniques were applied to cap lamps, machine-mounted lamps, and portable area lamps. Good results were obtained using incandescent, sodium, mercury-vapor, and fluorescent light sources. Principal problems included distribution wiring, voltage requirements, and startup and restart relays (for the sodium and mercury-vapor light sources). Probably the most significant problem, particularly with sodium and mercury-vapor lights, was to provide sufficient illumination while preventing glare or temporary blindness produced by either looking at the light source or walking out of the illuminated area.

In strip mining, the trend was towards larger equipment, particularly for overburden removal, loading, and haulage.

Haulage trucks continued to get bigger, more powerful, and more versatile. One of the more promising trends in off-highway coal-hauler design is the integration of the power and drive trains and the payload body into a single-unit chassis, in contrast with the conventional tractor-trailer design. Integrated units with a 150-ton payload capacity started operation in 1970, and 250- to 300-ton units were in design stages.

To negotiate slippery roads, difficult grades, and tight turns, all-wheel-drive haulage units are becoming increasingly popular. Articulated chassis were incorporated on some all-wheel-drive units to reduce tire wear.

Conveyor belts are becoming increasingly popular for transporting coal at many surface-mining operations. As annual tonnages and haulage distances increased, the overall installation and operating costs of conveyor belts became more favorable. Today some operators of surface mines are considering shiftable and portable conveyor systems in the pits, presently used at some European operations.

Tractor-scrapers continued to prove versatile at both production and reclamation operations, and are becoming quite prevalent at western and Appalachian mines for removing and stockpiling topsoil and other suitable materials for later replacement on graded mined lands. Some surface mines use tractor-scraper units as the primary means for overburden removal. As the use of units of this type increases, more efficient power trains and other improved design features are being introduced.

New designs of blades and attachments and more powerful engines were introduced during 1975 for bulldozers.

Bucket wheel excavators are proving to be a valuable reclamation tool. In the relatively flat land of the Midwest, bucket wheel excavators are used to remove topsoil and upper layers of overburden. Power shovels then remove the remaining drilled and blasted strata above the coalbed. In Illinois, these wheel-shovel combinations are utilized as often as draglines for primary overburden removal.

In Appalachia, new methods were used to meet surface mining regulations relating to highwalls and slopes. The haulback technique was highly successful in 1975 in West Virginia, where more than 20 surface mining companies used or were planning to use haulback techniques.

Although the haulback concept is not new, it had never been tried on long, steep slopes. The mining operation requires precise, controlled blasting (so that no material goes down the slope); the overburden is then hauled from the working site in trucks for the use as backfill in nearby worked-out areas. This technique reduced the amount of disturbed lands by up to two-thirds in many cases.

About 41% of the bituminous coal and lignite produced in 1975 was mechanically cleaned. Cleaning equipment consisted of a variety of jigs, tables, launderers, dense-medium and flotation washers, and pneumatic devices, but all depend upon the difference in specific gravity between coal and impurities, for separation. The specific cleaning method chosen depends on the size of coal to be upgraded, the composition of the raw product, and the chemical-quality specifications imposed by the consumer. In general, American coals are easy to clean except when the sulfur is structurally bound in the coal matrix as organic compounds, or is present as finely divided pyritic (inorganic) compounds. Some coal can be crushed to free coarse pyritic sulfur, but as the particle size becomes smaller, the problem of separation becomes more difficult and costly. The designs of coal preparation equipment are well advanced and commercially available.

Coal mining research is currently aimed at increasing the productivity and unit operating capacities of mining systems without adversely affecting safety or the environment. Toward this end, the Bureau of Mines has been conducting intensive, long-range coal mining and exploration research programs. Because of the geographic and stratigraphic distribution of coal resources, a continuing production mix from both surface and underground mining is needed. Accordingly, the near-term goal of the program is to develop technologies that will result in significant increases in production, productivity, and coal recovery with present surface and underground mining methods.

In the exploration program, emphasis is being placed on securing more definitive geologic and geochemical data on many coal deposits, particularly those in the Western States. Although coal reserves are adequately identified for short-term policy and production needs, extended data are needed to provide industry with better knowledge on which to base their regional mining extraction plans, and also to determine the environmental impact of mining.

The environmental studies will concentrate on developing criteria to measure the impact of mining on the ecosystem. Most of the research on environmental protection technology will be integrated with the research on new mining systems.

The major goals in the mining technology program are to (1) increase the production per shift from both conventional and continuous mining by increasing the reliability of existing equipment, (2) improve productivity substantially by the automation or remote control of as many operations as possible, (3) accelerate the use of longwall mining to increase the percentage of coal recovered and mine more efficiently and safely coal deposits at greater depths and under difficult strata conditions, (4) recover methane from the coalbed prior to mining to speed production by eliminating methane problems and to utilize the methane, (5) develop mining systems that can economically recover 80% or more of thick and steeply pitching seams of coal in certain western deposits, (6) develop the technology to provide adequate protection of the surface environment from underground mining such as subsidence and water contamination, and (7) to reduce the time required to develop new mines and bring them to full production.

The major goal of the Bureau of Mines for advancing technology in surface mining is directed toward integrating excavation and reclamation to reduce the environmental impact. Equipment will be developed where specialized needs are identified that would improve the efficiency of mining and restoring the surface. The Bureau is trying to improve efficiencies of large stripping equipment by automating the dig-haul-dump-spread cycle. Reclamation techniques are being developed that will be particularly adaptable to the arid and semiarid western coal regions.

In coal preparation practices, the design features of units using gravity separation are fairly well established. There will be improvements in design and operating features permitting better separation methods, including greater reduction of pyritic sulfur. The demands of the metallurgical market will impose increasingly stringent requirements on grades of coal, especially in regard to sulfur content. Similarly, electric utilities, which constitute coal's major growth area, are being required to burn low-sulfur coals until air pollution regulations are met by either the reduction of sulfur content in coals or through the development of processes for the removal of sulfurous pollutants from flue gases. Some of the processes being developed by the private industry appear to be nearing technical feasibility.

Although coal is used primarily as a fuel to generate heat and power, considerable research is underway to develop new uses. Among the new processes in various stages of research or development are those dealing with the production of carbon black from coal, the synthesis of foodstuffs, the treatment of sewage and organic wastes with coal, and conversion of coal to synthetic gas and liquid fuels.

The production of gaseous and liquid fuels from coal is not economically feasible at the present time in the United States. Research is underway, however, to reduce conversion costs by improving process technology. Probably two of the greatest technical drawbacks in converting coal to high-Btu gaseous or liquid fuels is the large volume of costly hydrogen required and the performance of the catalyst in the methanization step of the process. To overcome the hydrogen deficiency, many methods have been studied for producing low-cost hydrogen. Other conversion research includes developing processes that produce a char and a liquid fuel, and improving catalysts used in both liquid and gas conversion processes. Large-scale commercial conversion of coal to gaseous and liquid fuels will depend on many variables in addition to technology, such as the rate of new oil and gas discoveries, oil import policy, the price of indigenous oil and gas supplies, and the progress made toward using oil shale.

[1] Prior to 1955 the average heat content of the annual output of bituminous coal and lignite was measured at 13,100 Btu's per pound. This value was based on an estimate made in 1949 (U.S. Bureau of Mines Information Circular 7538). In recent years this heat value has not been representative of the average unit heat value of the total annual coal supply because of the large annual increases in utilization of coal of lower heat values by the electric utility industry. The annual production values shown in this table are weighted averages of known and estimated Btu values of coal shipments to each major consuming sector. They include, for example, the Btu value of coal consumed at electric utility generating plants as reported to the Federal Power Commission and compiled by the National Coal Association. Currently, electric utility plants account for 70% of total domestic coal consumption. The averages for U.S. consumption exclude shipments overseas and to Canada the preponderance of which is of high-Btu-value metallurgical coal thus accounting for the difference in values between total production and domestic consumption.

W Withheld to avoid disclosing individual company confidential data.

[1] Includes coal loaded at mines directly into railroad cars or river barges, hauled by trucks to railroad siding, and hauled by trucks to waterways.

[2] Includes coal used at mine for power and heat, made into beehive coke at mine, used by mine employees, used for other purposes at mine, and shipped by slurry pipeline in Arizona.

[3] Data may not add to totals shown because of independent rounding.

[4] Value received or charged for coal, f.o.b. mine. Includes a value, estimated by producer, for coal not sold.

W Withheld to avoid disclosing individual company confidential data.

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by trucks to railroad sidings, and hauled by trucks to waterways.

[2] Includes coal used at mine for power and heat, made into beehive coke at mine, used by mine employees, used for all other purposes at mine and shipped by slurry pipeline in Arizona.

[3] Data may not add to totals shown because of independent rounding.

[4] Value at average prices that might have been received if such coal had been sold commercially.

[5] Auger production included with strip production figure to avoid disclosing individual company data.

[6] One mine extends into two counties but is counted only in the county where its greater production occurred.

[7] Less than 500 tons.

Table 19.—Production, method of operation, and equipment at underground bituminous coal mines, by State, in 1975

(Thousand short tons)

[1] Federal Power Commission.

[2] Bureau of Census, U.S. Department of Commerce, Ore and Coal Exchange.

[3] Estimates based upon reports collected from a selected list of representative steel and rolling mills.

[4] Estimates based upon reports collected from a selected list of representative manufacturing plants.

[5] Estimates based upon reports collected from a selected list of representative retailers. Includes some coal shipped by truck from mine to final destination.

[6] The total of classes shown approximates total consumption. The calculation of consumption from production, imports, exports, and changes in stocks is not as accurate as the "Total of classes shown" because certain significant items of stocks are not included in monthly stocks. These items are stocks on lake and tidewater docks, stocks at other intermediate storage piles between mine and consumer, and coal in transit.

[1] Federal Power Commission.

[2] Days' supply is calculated by dividing the total stocks at the end of the month by the daily average rate of consumption during the same month. By this method, seasonal variation in daily average rate of consumption is not reflected.

Table 42.—Distribution of bituminous coal and lignite, in 1975, by method of movement and consumer use

(Thousand short tons)

Shipments	Electric utilities	Coke and gas plants	Retail dealers	All others	Railroad fuel	Used at mines and sales to employees

[r] Revised.

[1] Less than 0.1%.

[2] Included shipments to Canadian Great Lakes commercial docks and railroad companies.

[3] Includes overseas exports from producing districts 13, 14, 17, and 20.

[4] Includes overseas exports from producing districts 13, 14, and 20.

[5] Includes overseas exports from producing districts 13 and 14.

[6] Excludes overseas exports from producing districts 13, 14, 17 and 20.

[7] Excludes overseas exports from producing districts 13, 14, and 20.

[8] Excludes overseas exports from producing districts 13 and 14.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, Ecuador produces coal, but output was less than 500 tons annually in the years covered by this table.

[2] Includes material reported in national sources as brown coal.

[3] Available sources report only lignite production; a small amount of bituminous coal may also be produced.

[4] Official sources report the aggregate of bituminous coal and anthracite; distribution to these separate grades is estimated from reported total.

[5] Revised to zero.

[6] Output from Norwegian controlled portion only. Output of that portion of Svalbard controlled by the U.S.S.R. is presumably included in the total output recorded for that country. The U.S.S.R. output in short tons was as follows: 1973, 536,000; 1974, 540,000; 1975, 440,000.

[7] Run-of-mine output.

[8] May include a small amount of anthracite.

[9] Sales for year ending August 31 of that stated.

[10] Year beginning March 21 of that stated.

[11] Data include low-ranked coals, including some lignite.

[12] Year ending June 30 of that stated.

[13] Includes private sales.

[14] Bituminous coal plus lignite for the People's Republic of China and Pakistan.

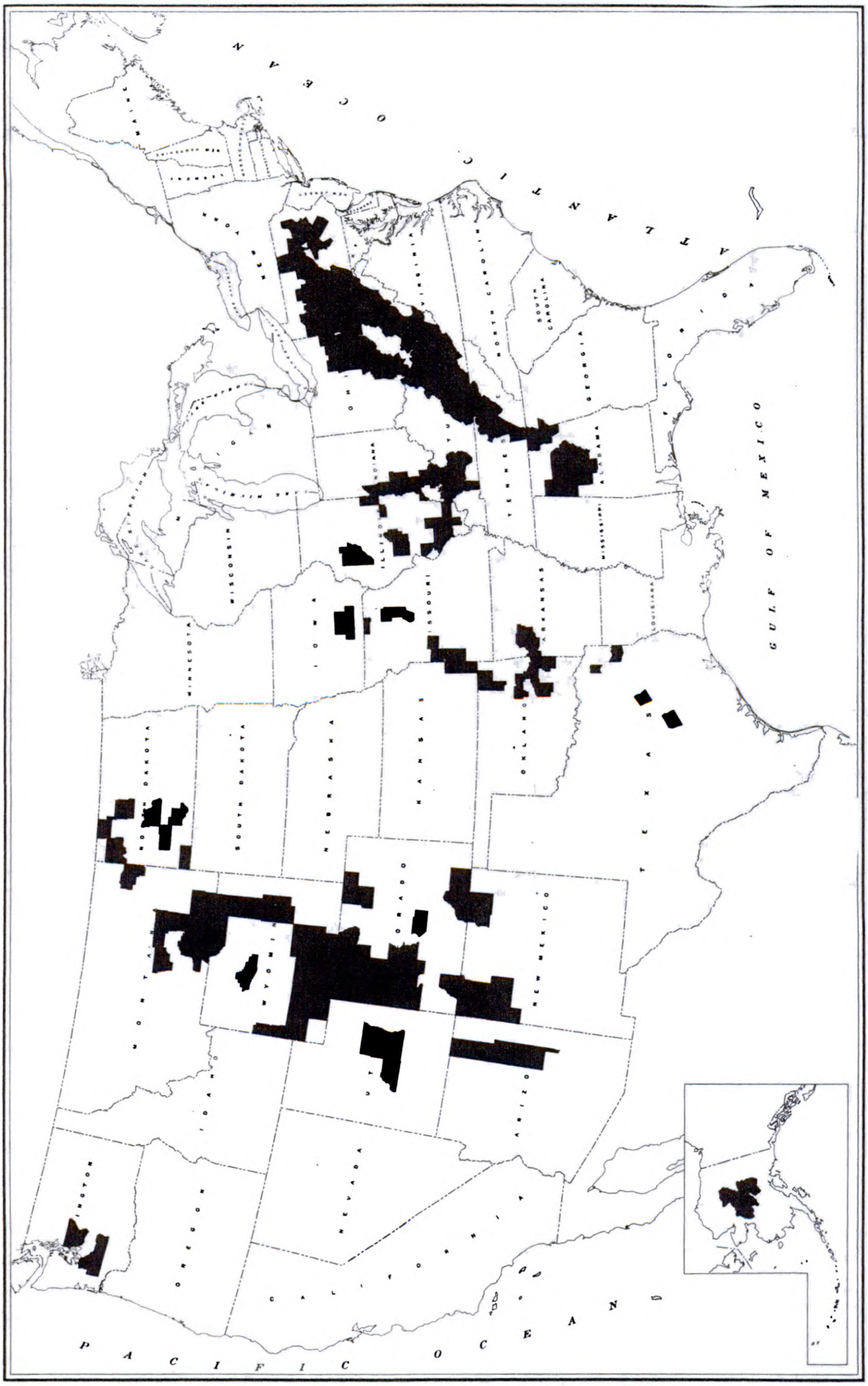

Figure 8.—Coal producing counties in the U.S. in 1975.

Coal-Pennsylvania Anthracite

By Dorothy R. Federoff [1]

All of the reported production of anthracite in 1975 was in northeastern Pennsylvania. The anthracite region is divided geologically into four fields: Eastern Middle, Northern, Southern, and Western Middle. The area is also grouped into three trade regions: Lehigh, Schuylkill, and Wyoming.

The total production in 1975 was 6.2 million short tons, a decrease of 6.3% from that of 1974. The decrease was the result of a miners' strike in April during negotiation of a new wage agreement and the loss of productivity per man-day. Of the total output, 47% was recovered from culm and silt banks, 42% was produced at strip pits, 10% was from underground mines, and approximately 1% was recovered from dredging operations. Compared with tonnages produced in 1974, culm recovery declined 0.6%; strip production, 10.6%; underground production, 2.4%; and the recovery of river coal, 49.3%.

Total value of the 1975 output was $198.5 million, a 37% increase over that of 1974. The average commercial value, f.o.b. preparation plants for all sizes, including dredge coal, was $31.99 per ton, compared with $21.87 per ton in 1974. The average value of pea and larger sizes increased $14.63 per ton (from $30.41 to $45.04), and the average value of buckwheat No. 1 and smaller sizes increased $8.78 per ton (from $18.53 to $27.31).

Apparent consumption of Pennsylvania anthracite in the United States in 1975, calculated as production minus exports (including that exported to West Germany for use by the U.S. Armed Forces), totaled approximately 5.1 million tons, compared with 5.4 million tons in 1974—a decrease of 6%. Overall consumption was as follows: Space heating, 41.7%; electric utilities, 29.0%; coke making, 6.4%; sintering and pelletizing, 4.6%; colliery fuel, 0.2%; and other industrial uses, 18.1%.,

According to the U.S. Bureau of Census, exports of anthracite for 1975 totaled 639,601 tons, with a net value of $25.8 million. A 13% decrease in shipments was indicated, compared with 1974 exports. A more complete measurement of exports can be obtained by adding the quantity shipped for use by the U.S. Armed Forces in West Germany to the tonnage reported by the Bureau of Census. This computation indicates that 1,095,293 tons of anthracite was actually exported in 1975, a decrease of 6% from 1974 exports.

The Pennsylvania anthracite-mining industry worked an average of 214 days in 1975 and employed a work force of 3,907. Of that total, 733 were employed at underground mines, 1,468 at strip operations, 400 in the recovery of culm and silt banks, 15 in the dredging operations, and 1,291 at preparation plants and other surface operations. In operation were 109 underground mines, 100 strip pits, 133 culm and silt banks, 8 dredges, and 91 preparation plants.

Although the work force increased 1.6% in 1975, the decline in production was attributable to the strike during April and the loss of productivity per man-day. The productivity rate in average tons per man-day decreased from 7.87 in 1974 to 7.45 in 1975. One fatality occurred in 1975 (two in 1974), and nonfatal injuries increased from 262 in 1974 to 351 in 1975.

The Bureau of Mines publishes a series of weekly and monthly reports containing estimates of production derived primarily by factoring data on carloadings furnished by the railroads and monthly truck shipments provided by the Commonwealth of Pennsylvania. The weekly and monthly estimates have been adjusted to the production total for 1975 and are presented in tables 13 and 14. Selected historical data are presented in table 27.

---

[1] Mineral specialist, Division of Fuels Data.

Legislation and Government Programs.—State and Federal Government public-works programs in the environmental area continued throughout 1975, and included control and extinguishment of fires at abandoned underground mines, reclamation of old strip pits and culm banks, and extinguishment of burning coal mine refuse banks. In addition, mine-water control projects were designed to secure the safety and livelihood of mine personnel and to protect anthracite reserves from the hazards of adjoining abandoned mine pools and possible inundation by surface flood waters.

Hydrologic studies were continued to evaluate mine-water problems. These involved determination of the varying heights of underground mine pools, their hydrostatic pressures, and their possible effect on barrier pillars and mine dams protecting active mining operations, and on acid mine-water drainage into surface streams and the unconsolidated valley fill. Under the closely related mine-water control program, a comprehensive series of mine-pool monitoring stations have been installed, and additional phases of the project are proceeding in the Western Middle, and Southern fields.

A program continued for mined-land demonstration activities mainly directed to public health and safety problems associated with mine subsidence. Progress included the adaptation of pressure flushing to larger sized mine refuse materials and efforts to monitor the effectiveness of mine sealing and flushing. Efforts included investigations into the causes and environmental effects of mine subsidence, attempts at early detection, an inventory of cases of subsidence, and development of more economic techniques for controlling and preventing mine subsidence.

The value of the longstanding map-folio program to the public was demonstrated by the numerous requests received by the Bureau of Mines from Federal and local authorities. The requests were for aid in evaluating subsurface conditions to determine subsidence potential for proposed civic improvements and as a cause of possible structural failure in bridges and highways. Work continued on compiling surface and bed maps in stratigraphic sequence for selected areas.

Table 1.—Salient statistics of the Pennsylvania anthracite industry

	1971	1972	1973	1974	1975
Production:					
Preparation plants ------- short tons --	8,323,168	6,618,205	6,377,512	6,454,385	6,117,156

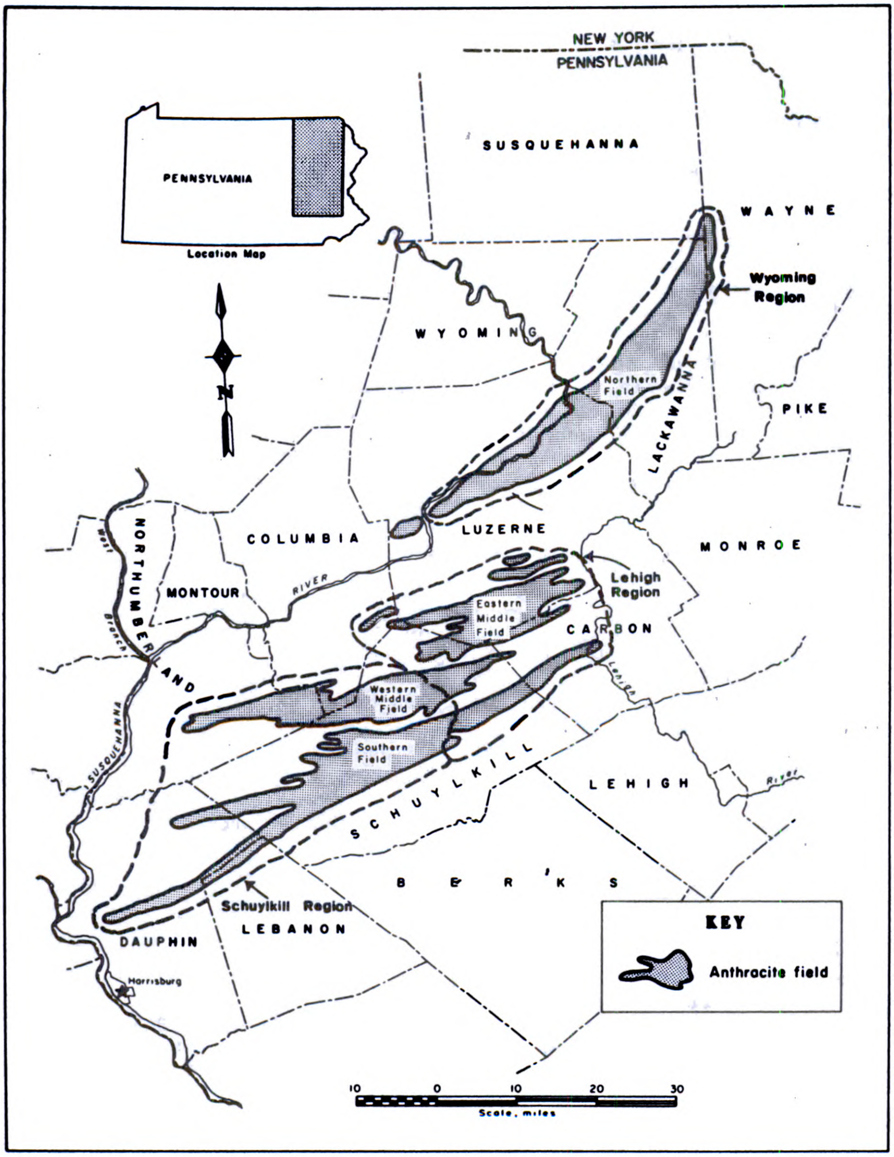

Figure 1.—Coalfields, regions, and counties of the Pennsylvania anthracite area.

DOMESTIC PRODUCTION

Underground production continued to decline because of the health and safety regulations, manpower shortage, and the high cost of pumping water from flooded mines. The output from underground mines in 1975 totaled approximately 641,000 tons, a decrease of 2.4% from that of 1974. The Schuylkill region accounted for 99.1% of the output, and the Wyoming region for the remainder.

Production from strip operations totaled about 2.6 million tons, a decrease of 10.6%. In the Schuylkill region, strip mine production totaled 1.3 million tons, a decrease of 10.0%; in the Lehigh region, 1.1 million tons, a decrease of 11.6%; and in the Wyoming region, 189,000 tons, a decrease of 9.1% from that of 1974.

Culm and silt recovery remained at almost the same level—2,922,000 tons in 1975 (2,940,000 tons in 1974). Of the total, 720,000 tons was recovered in the Lehigh region, an increase of 53.8% over that in 1974, and 710,000 tons was recovered in the Wyoming region, an increase of 63.2%. However, the 1,492,000 tons recovered in the Schuylkill region showed a decline of 26.8% from that of 1974.

Dredging operations produced approximately 76,000 tons in 1975, compared with 150,000 tons in 1974—a drop of 49.3%. Several operations were discontinued because insufficient coal remained in the riverbed to make the salvage operations economically feasible.

Total production in the Lehigh region for 1975 was 6.8% greater than in 1974. A decrease of 11.6% in strip mine production was offset by a 53.8% increase in the recovery of anthracite from culm banks. The Schuylkill region had a decrease in production of 17.6% from that in 1974. Although underground production increased 1.9%, all of the other categories had losses: Strip production, 10.0%; culm bank recovery, 26.8%; and the recovery of river coal, 49.3%. Output in the Wyoming region increased 33.7% over that in 1974. The 63.2% increase in the recovery of anthracite from culm banks compensated for the decreases in underground and strip mine production of 82.4% and 9.1%, respectively.

Mechanical loading of underground anthracite in 1975 declined 2.6% from the 1974 level. However, the loading units dropped 60.4%, owing to the closure of a large underground mine in the Wyoming region. Although the total output of mechanically loaded coal decreased by 8,000 tons from the 1974 output, the percentage that was mechanically loaded remained the same—47%. In operation were 15 scraper loaders, 4 mobile loaders, and 25 conveyor and pit-car loaders.

Equipment used in the stripping operations and culm recovery consisted of 146 front-end loaders, 43 power shovels and 105 draglines—relatively comparable to that in 1974.

The three leading counties in the production of anthracite were Schuylkill County, with a total of 2,997,000 tons; Luzerne County, 1,522,000 tons; and Northumberland County, 798,000 tons. Other counties producing anthracite were Berks, Carbon, Columbia, Dauphin, Lackawanna, Snyder, and Sullivan.

DISTRIBUTION

Reports submitted to the Bureau of Mines by producers, wholesalers, and exporting firms indicated that 5,946,229 short tons of Pennsylvania anthracite was shipped during the 1975 calendar year—a decrease of 4.7% from that of 1974. Where possible, coal used largely for generating electricity and for colliery fuel was eliminated from the statistics. Of the total shipped to market during the year, 81.6% was shipped to points in the United States (a decrease of 4.3% from that in 1974); exports to the Canadian market totaled 543,552 tons, or 9.1% of the total (an increase of 12.9% over 1974 shipments); and exports to countries other than Canada totaled 551,741 tons (a decrease of 19.8% from those in 1974).

In the U.S. market, shipments of pea and larger sizes continued to decline (24.3% in 1975; 12.7% in 1974). In contrast, the demand for industrial sizes continued to increase—3.1% in 1975 compared with 2.3% in 1974. The pea and larger sizes comprised 21.3% of the total distributed (26.9% in 1974), and buckwheat No. 1 and smaller sizes comprised 78.7% of the total (73.1% in 1974). Shipments in the Middle Atlantic States increased 1.1% over those in 1974, but other shipments declined: Those to the New England States, 26.4%; to the South Atlantic States, 48.1%; to the Lake States, 28.0%; and to Other States, 21.6%.

Of the total anthracite distributed, 3,802,641 tons was shipped by truck and the remainder by rail. Additional details of anthracite distribution for 1975 are presented in a Bureau of Mines report.[2]

---

[2] U.S. Bureau of Mines. Distribution of Pennsylvania Anthracite for the Calendar Year, 1975. Mineral Industry Survey, Oct. 15, 1975, 8 pp.

CONSUMPTION AND USES

Domestic consumption of Pennsylvania anthracite in the United States in 1975, calculated as production minus exports (excluding shipments to the U.S. Armed Forces in West Germany), totaled 5.1 million net tons, compared with 5.4 million tons in 1974—a decrease of 5.6%. Consumption of anthracite for space heating declined 17.4%, principally because of losses to competitive fuels. Consumption of anthracite by the steel industry declined because, throughout most of 1975, steel customers were working their inventories down to levels more in line with their business activities. The process continued into the third quarter, resulting in lower steel-product shipments in 1975, compared with those in the same period in 1974. Overall consumption was as follows: Space heating, 41.7%; electric utilities, 29.0%; coke making, 6.4%; sintering and pelletizing, 4.6%; other industrial uses, 18.1%; and colliery fuel, 0.2%. Although consumption for "other industrial uses" increased 68.2% over that of 1974, declines were indicated in the electric utilities, 1.1%; coke making, 26.6%; sintering and pelletizing, 35.4%; and colliery fuel, 16.7%.

STOCKS

Monthly data on stocks held at retail dealers' yards indicated an inventory of 59,000 tons at yearend 1975, a decrease of 35.2% from that of yearend 1974.

Electric utilities reported an increase of 5.6% in their inventories—982,000 tons at yearend 1975 compared with 930,000 tons at the end of 1974.

Stocks at coke plants totaled 126,000 tons at yearend 1975, a decrease of 26.7% from the 172,000 tons at yearend 1974.

Stocks at Upper Lake Docks (Lake Superior and Lake Michigan) were less than 500 tons at yearend 1975, relatively comparable to those at yearend 1974.

PRICES AND SPECIFICATIONS

Based on total production, including colliery fuel and dredge coal, the average value per ton for 1975 was $31.99 f.o.b. preparation plant, compared with $21.87 per ton in 1974, an increase of 46.3%. The average value per ton of the larger size groups in 1975 was $45.04 f.o.b. preparation plant, an increase of $14.63 from that in 1974. The prices for individual sizes (excluding dredge coal) were as follows: Egg, $45.82 (an increase of $12.91); stove, $46.59 (an increase of $15.05); chestnut, $45.34 (an increase of $14.28); and pea, $42.33 (an increase of $14.72).

The average value of the smaller size groups was $27.61 per ton f.o.b. preparation plant, compared with $18.88 per ton in 1974, an increase of $8.73. The individual prices for the smaller sizes were buckwheat No. 1, $43.50 (an increase of $15.14); buckwheat No. 2 (rice), $39.86 (an increase of $13.13); buckwheat No. 3 (barley), $37.43 (an increase of $14.27); buckwheat No. 4, $33.80 (an increase of $14.45); buckwheat No. 5, $25.74 (an increase of $6.92); and the "other" category, $12.29 (an increase of $3.52).

The Black Diamond magazine quoted wholesale prices f.o.b. preparation plants in 1975 as follows: Egg, stove, and chestnut, $42.50 to $47.50; pea, buckwheat No. 1, and buckwheat No. 2 (rice), $37.50 to $42.50; and buckwheat No. 3 (barley), $35.50 to $42.50.

FOREIGN TRADE

According to the data released by the U.S. Bureau of Census, 639,601 short tons of Pennsylvania anthracite was exported in 1975, a decrease of 13% from that shipped in 1974. Of the total, 85% was exported to Canada (an increase of 12.9% over that shipped in 1974), 1.3% to South America, 0.5% to Asia, and the remainder to other countries. The Census Bureau figures do not include anthracite shipped abroad for the use of U.S. Armed Forces in West Germany; therefore, a more complete measurement of exports can be obtained by adding the military tonnage (455,692 tons) to the tonnage reported by the Bureau of Census. Consequently 1,095,293 tons of anthracite was exported in 1975.

WORLD REVIEW

Complete data on output are not available from all anthracite-producing countries. Some data are only estimates, while other data include coals that, by U.S. standards, are of no higher quality than semianthracite. Despite these inadequacies, the information is sufficiently accurate to indicate general trends. Based on such information, and in full recognition of the margin of error that could exist, it is indicated that total world production in 1975 was 195.2 million tons, an increase of 0.8% over the 193.7 million tons produced in 1974.

The combined output of the U.S.S.R., North Korea, the People's Republic of China, and the Republic of Korea totaled 160.4 million tons, or 82.2% of total world production. Countries registering increases in the production of anthracite include the Republic of Korea, 15.3%; Morocco, 13.6%; North Vietnam, 12.8%; the Republic of South Africa, 10.9%; Spain, 4.4%; North Korea, 2.9%; and the U.S.S.R., 0.4%.

China, People's Republic of.—Coal deposits are known to exist in widespread areas of China, ranging in quality from brown coal through all types of bituminous coal to anthracite. The biggest anthracite producer is Yangchuan, comprising 12 pairs of mine shafts, or 4 to 6 mines, in Shansi Province. Yangchuan increased its production in 1975. The other major anthracite-producing district is Mentoukou. These two major districts combine with other smaller districts to produce 22 million tons of anthracite annually.

Japan.—Production of anthracite in 1975 totaled 101,000 tons, compared with 154,000 tons in 1974—a decrease of 34.4%. Imports totaled 1,131,000 tons, a decline of 32.4% from that of 1974. The principal sources were North Vietnam, 555,183 tons (a decrease of 24.2%); the People's Republic of China, 367,284 tons (a decrease of 9.2%); and Canada, 112,440 tons (a decrease of 24.1%). The total comprised 91.5% of the anthracite imported in 1975. The remainder was imported from North Korea, the Republic of South Korea, the Republic of South Africa, the U.S.S.R., and the United States.

Korea, North.—Output of anthracite totaled 35.0 million tons in 1975, a 2.9% increase over the 34.0 million tons in 1974. Geological prospecting teams reportedly have discovered coal deposits that will play a big role in attaining the 110.0-million-ton coal-output target. Fairly large deposits are located in the Inchon and Ipsok districts. Prior to the recent discovery, coal deposits estimated at tens of millions of tons were discovered in the Tokchon district, south Pyongyang Province. A coalfield is being developed in the Namyang district in the same Province. Anthracite deposits estimated at 8 billion tons are primarily in the vicinity of Pyongyang. Mass movement of coal has an important role in North Korea's rapidly expanding coal industry; consequently, pipes, cableways, and belt conveyors are being introduced in various areas of the coal regions. The latest coal mining project to be completed is the 10-mile cableway.

Mexico.—Virtually all coal reserves lie in the areas of Barrancas, Oaxaca, and Coahuila. Barrancas contains an estimated 22 million tons of coal, predominantly anthracite. The largest consumer of solid fuels in Mexico is the steel industry. As indigenous coal production increases, imports will in all probability decline. Imports of anthracite from the United States in 1975 totaled 12,128 tons, compared with 10,317 tons imported in 1974—an increase of 17.6%.

Morocco.—Production of anthracite in 1975 totaled 719,000 tons, an increase of 13.6% over that of 1974. Despite local unemployment in the past, it has been difficult to recruit labor owing to poor working conditions and wages. At present, mechanization plans are underway that should ultimately help improve these conditions. Although the expansion program is primarily to satisfy domestic requirements, demand for coal is expected to decline in favor of oil. It is therefore possible that limited quantities of anthracite could be made available for export.

Peru.—A survey conducted by Kopex of Poland indicated that coal deposits at Alto Chicama (La Libertad) contain 270 million tons of anthracite, of which 59 million tons are proven reserves. The survey is part of a feasibility study for the development of the reserves and the construction of a 240-megawatt power station at Alto Chicama. Peru produced an estimated 11,000 tons of anthracite in 1975.

South Africa, Republic of.—Output of anthracite in 1975 totaled 1.8 million tons, an increase of 10.9% over that in 1974. The discovery of what is believed to be one of the richest coal deposits in Africa in the Nongoma district of Kwazula, South Africa, has been announced by Ubombo Mines. Investigations reportedly show that the reserves of anthracite will be greater than those of the rest of South Africa combined and could prove to be in excess of 100 million tons.

South Korea, Republic of.—The production of anthracite in 1975 totaled 19.3 million tons, compared with 16.9 million tons in 1974—an increase of 15.3%. South Korea's efforts to exploit indigenous coal reserves to the maximum extent to insure a stable supply of low-cost fuel for household needs will be assisted by the Asian Development Bank. The bank loan is for the foreign exchange component of the Coal Development Project, which consists of the rehabilitation and expansion of coal-production facilities at Dai Han Coal Corp. (DHCC), a wholly Government-owned corporation. The money will be used for overseas purchases of mining equipment, plant, and safety equipment and to cover the services of foreign consultants who will assist in the implementation of the project. The project is expected to be completed by the end of 1978; its aim is to increase DHCC's annual coal production from the current level of about 4.5 million tons to approximately 6.2 million tons in 1979. The Government plans to reduce the country's dependence on imported oil and maximize the development of coal and water power resources, as well as its utilization of atomic energy. The aim is to have coal products account for 34.1% of the total energy supply by the year 1980, an increase of 3.4% over the previous target. Proven coal reserves (predominately anthracite) are currently estimated to be in the range of 546 million tons. At present projected mining rates, the proven reserves are adequate to support coal production for 23 years.

Spain.—Although Spain produced 3.4 million tons of anthracite in 1975, an increase of 4.4% over that of 1974, imports rose from 6,758 tons in 1974 to 19,660 tons in 1975. Of the total, 19,335 tons was imported from the Republic of South Africa and the remainder from the Netherlands.

United Kingdom.—Output of anthracite in 1975 totaled an estimated 2.7 million tons, a decline of 3.3% from the 1974 level. At the large Maesgwyn opencast site, Glynneath, where an estimated 1.5 million tons of anthracite remains to be recovered, an 1,800-ton dragline, with a 247-foot boom and 40-cubic-yard-capacity bucket to remove overburden, is back in operation after a 12-month overhaul. The dragline is the largest in use in South Wales and the second-largest in Britain.

U.S.S.R.—Production of anthracite in 1975 totaled 84 million tons, an increase of 0.5% over that of 1974. The output of anthracite and bituminous coal in the Donetsk Basin is to reach an estimated 231 million to 233 million tons by 1980, and the projected 1985 figure is 245 million tons. Because this region contains vast fields of anthracite and coking coal, the U.S.S.R. will insure an increased output by renovating old mines, reopening new mines, and using highly efficient machines and techniques to increase capacities for coal extraction and processing. Principal recipients of the exports of anthracite are Europe and Japan.

Vietnam, North.—Output of anthracite totaled 4.4 million tons in 1975, an increase of 12.8% over that of 1974. Total known coal reserves, predominately anthracite, are estimated at 2.5 million to 3.0 million tons. The Hon Gai mine, the largest in the country, expects to produce about 4.4 million tons annually. The burgeoning coal export trade is likely to increase the utilization of the port of Hon Gai, although most coal for export is presently handled through Cam Pha. Japan may be importing coal in quantity from Vietnam; exports to Japan in 1975 totaled 555,183 tons.

TECHNOLOGY

The Energy Research and Development Administration (ERDA) is examining the combustibility characteristics of refuse materials from anthracite mining operations and reject streams of preparation cleaning plants in a fluidized-bed combustor at the Morgantown Energy Research Center, Morgantown, W. Va.[8]

The value of this refuse as a fuel is important in the anthracite region because of the decline in mining in the area, which has led to a growing dependence on oil. The burning of this material in fluidized-bed combustors would provide fuel in a region that needs fuel.

The atmospheric-pressure fluidized-bed combustor is basically a refractory-lined cylindrical combustor of 18-inch internal diameter in the bed region, with an expanded freeboard cross section of 24-inch diameter. The combustor is equipped with a horizontal, water-cooled heat exchanger submerged in the bed and a separate water-cooled tube bundle in the freeboard to reduce gas temperature. To control temperature with the low-heating-value refuse fuels, six hairpin loops of ¼-inch 310 stainless steel pipe with individual water-flow controls were installed. Fuel is pneumatically injected into the base of the combustor with room-temperature air. Fluidizing air is provided through a plenum that feeds a number of orifices in the conical distributor. The reject solids that are separated from the exit flue gas by the primary cyclone can be reinjected into the bed with an air injector for carbon burnup. Flue gases are further cleaned by the secondary cyclone and parallel bag filters before exiting through the stack. Gases are sampled for online analysis at the exit of the combustor. Excess spent bed material is withdrawn through the apex of the inverted conical air distributor with a screw feeder.

An operating period with the combustor typically lasts 5 days, 24 hours per day. Startup begins by preheating the empty combustor vessel with a premixed natural gas-air flame through the air distributor. When operating temperature is reached, the fluidized bed is built by feeding either a 50-50 mixture (by weight) of anthracite refuse and inert material (such as limestone) or with the anthracite refuse directly. When the planned bed depth has been achieved, the natural gas flow is curtailed, and the temperature of the bed is stabilized by adjusting water flow in the submerged heat exchanger followed by reinjecting the primary cyclone ash. The complete startup procedure requires 2 to 4 hours from cold lightoff to stabilization of temperatures with normal feeding of refuse and reinjected ash.

Two anthracite refuse materials with widely different characteristics have been burned to date—a fine silt refuse and a much lower quality material from a reworked bank. These refuse materials represent two extremes of fuel quality. The silt approaches anthracite in analysis and heating value, while the reworked refuse bank is much poorer in quality, containing mostly slate and "bone" (laminated coal) and slate agglomerate of medium-carbon value). The fluidized-bed combustor is well suited to burning such materials because of the inherent low carbon in the bed coupled with the good mixing and long residence times used to burn the relatively unreactive carbon found in the two waste materials. Generally, the combustion tests with these refuse materials have demonstrated satisfactory carbon burnout and smooth, sustained operations. The results indicate that the fuel value in the refuse carbon can be easily recovered in a fluidized-bed combustor. Fluidized-bed combustors with waste heat boilers located near the supply of anthracite waste could recover the heating value contained in this reject material and reduce the environmental impact of the refuse piles.

---

Buckwheat No. 3 (barley)	Through 3/16	--	--	--	--	15
	Over 3/32	20	10	--	--	--
Buckwheat No. 4	Through 3/32	--	--	--	--	15
	Over 3/64	30	10	--	--	--
Buckwheat No. 5	Through 3/64	NL	NL	--	--	16

NL No limit.

[1] When slate content in sizes from broken to chestnut, inclusive, is less than above standards, bone content may be increased by 1½ times the decrease in slate content under the allowable limits, but slate content specified above shall not be exceeded in any event.

A tolerance of 1% is allowed on maximum percentage of undersize and maximum percentage of ash content.

Maximum percentage of undersize is applicable only to anthracite as it is produced at preparation plant.

Slate is defined as any material that has less than 40% fixed carbon.

Bone is defined as any material that has 40% or more, but less than 75%, fixed carbon.

[2] Ash determinations are on a dry basis.

NOTE.—According to the Association of American Railroads, 582,185 short tons of anthracite were exported to Europe during 1975, compared with 589,174 short tons for 1974. Of this total 510,577 short tons were consigned to West Germany and the Netherlands including exports to the U.S. military forces. This compares with 412,611 short tons for 1974.

Other[2]	6.24	6.60	7.15	10.66	13.07	4.44	5.16	5.78	8.77	12.29
Total buckwheat No. 1 and smaller	11.50	12.71	13.85	16.51	24.01	9.90	10.14	11.30	18.88	27.61
Grand total	13.70	14.94	16.33	20.11	26.96	12.08	12.40	13.65	22.19	32.26

[1] Value of lump included is insignificant.
[2] Includes various mixtures of buckwheat Nos. 2 to 5 and coal of relatively low dollar value.
[3] Includes Sullivan County.

Table 18.—Average value of Pennsylvania anthracite from all sources, by region[1]

(Per net ton)

Region	1974				1975			
	Shipped by rail	Shipped by truck	Colliery fuel	Total	Shipped by rail	Shipped by truck	Colliery fuel	Total
Lehigh	$27.11	$25.79	$26.05	$26.45	$41.52	$30.02	$38.91	$35.11
Schuylkill	23.84	18.71	22.53	20.36	40.54	27.68	36.86	31.72
Wyoming[2]	22.27	19.28	21.95	20.11	38.25	25.45	46.89	26.97
Total	24.85	20.18	23.64	21.87	40.80	27.81	37.97	31.99

[1] Value given for shipments is that at which coal left possession of producing company; does not include selling expenses.

[2] Includes Sullivan County.

Table 19.—Wholesale prices of Pennsylvania anthracite in 1975, by size[1]

(Per short ton)

Size	Winter	Spring	Summer-Fall	End of year
Egg and stove	$42.50–$43.00	$47.25–$47.50	$47.25–$47.50	$47.25–$47.50
Chestnut	42.50– 42.75	47.00– 47.50	47.00– 47.50	47.00– 47.50
Pea	37.50	42.00– 42.50	42.00– 42.50	42.00– 42.50
Buckwheat No. 1	37.50	42.00– 42.50	42.00– 42.50	42.00– 42.50
Buckwheat No. 2 (rice)	37.50	42.00– 42.50	42.00– 42.50	42.00– 42.50
Buckwheat No. 3 (barley)	35.50– 36.50	42.00– 42.50	42.00– 42.50	42.00– 42.50

[1] As quoted in the Black Diamond Magazine. All prices are per short ton f.o.b. at mines.

Table 20.—Employment at operations producing Pennsylvania anthracite (including strip contractors) in 1975

[e] Estimate. [p] Preliminary. [r] Revised.

[1] An unspecified amount of semianthracite is included in figures for some countries.

[2] In addition to the countries listed, Canada, Colombia, New Zealand, and South Vietnam produce anthracite, but the level of production is not recorded and available information is inadequate to make reliable estimates; output in Colombia may total 100,000 tons annually, while output in New Zealand and South Vietnam is insignificant.

Cobalt

By Scott F. Sibley[1]

Demand for cobalt declined significantly in 1975 in line with general industrial activity. However, consumption accelerated during the last quarter. Total reported consumption of cobalt in the United States in 1975 was 12.8 million pounds, the lowest since 1971 and 32% below that of 1974. The major decreases in consumption in order were superalloys, magnetic alloys, and cutting and wear-resistant materials. Government releases of cobalt from the strategic stockpile were a significant source of supply during 1975, with over 6.3 million pounds delivered to consumers.

Legislation and Government Programs.—The General Services Administration (GSA) continued to offer cobalt metal in various forms for sale during 1975. Sales were on an unrestricted-bid basis except that total sales of specification-grade material were limited to about 1 million pounds per month and 500,000 pounds per bidder per month. The stockpile objective for cobalt remained at 11,945,000 pounds in 1975. As of December 31, 1975, the total U.S. Government stockpile inventory was 47,649,355 pounds of cobalt. Government sales of cobalt for the year totaled 4,896,384 pounds, compared with 8,649,811 pounds sold in 1974. Deliveries of cobalt from Government stockpiles from current or prior year sales totaled 6,345,327 pounds.

r Revised.

DOMESTIC PRODUCTION

There was no domestic mine production of cobalt in 1975. However, Amax Inc. continued to refine cobalt at its refinery in Braithwaite, La. The production level rose to about 30% of capacity in October 1975 and was expected to reach 75% of capacity in 1976. This could result in a production of 900,000 pounds of cobalt for 1976. Nickel-cobalt and copper-cobalt matte was supplied to the plant from New Caledonia, Botswana, and the Republic of South Africa. Total cobalt production at the refinery in 1975 was 65,000 pounds.

An international consortium was formed to recover cobalt-bearing manganese nodules from the sea floor, raising to three the number of organizations with American interests active in ocean mining research and development. Participants in the venture were International Nickel Co. Inc. of both Canada and the United States; Deep Ocean Mining Co. of Japan; and a German group comprised of Metallgesellschaft AG; Preussag, AG; Rheinische Braunkohlenworke AG; and Saligitter AG.

---

[1] Physical scientist, Division of Ferrous Metals.

The Second United Nations International Law of the Sea Conference was held in Geneva, Switzerland, in the spring, and another conference to be held in New York City was scheduled for late March of 1976. Legal and other problems associated with ocean mining were not resolved at the Geneva meeting.

The Bureau of Mines undertook a feasibility study of a 5,000-ton-per-day plant to recover nickel and cobalt from laterite ore in northern California and southwestern Oregon. Using a new Bureau of Mines process (See Technology section), as much as 1.5 million pounds of cobalt could be produced per year.

The environmental debate over development of the Duluth Gabbro (Minnesota) copper-nickel-cobalt deposit continued during the year. Officials of International Nickel Co. Inc. stated their unwillingness to proceed with development until the pollution restrictions were clarified by the State. Amax Inc. was also interested in the deposit and was planning further development. However, no actual mining was expected before 1983.

CONSUMPTION AND USES

Consumption of cobalt in the United States in 1975 dropped significantly, but consumption trended upward during the last quarter of 1975 in line with general industrial activity. The 12.8 million pounds reported to be consumed was the lowest since 1971 and 32% below that of 1974. Of the cobalt consumed in the United States in 1975, 72% was as metal, 22% as salts and driers, 3% as oxide, and 3% as purchased scrap. Consumer stocks declined 10% from their 1974 yearend level.

Rare earth-cobalt magnets continued to dominate the news related to new products containing cobalt. In one technologic advance, announced by Kollmorgen Corp.'s Inland Motor Division of Hartford, Conn., cobalt-bearing permanent magnets were used in a new type of servo motor (direct current). Its benefits reportedly include considerable savings in copper and iron, and a reduction in the magnet's overall weight, with no decrease in motor performance.[2]

Th. Goldschmidt AG of Essen, West Germany, developed a patented process for the production of rare earth-cobalt alloy powders ("TEGOMAG" powders). The process reportedly eliminates several steps in production, thus cutting costs, and is based on a calciothermic reduction of oxidic starting materials.[3]

A new electric car, the Transformer 1, developed by Electric Propulsion Corporation of Troy, Mich., used lead-cobalt batteries that can be charged in several different ways. One method is to use a conventional slow charge with an onboard charger. Using an external fast charger, an 80% recharge takes only 45 minutes. For long-distance trips, the mobile charger can be towed to continuously recharge the batteries while driving. The batteries energize a 37 horsepower DC motor.[4]

The Stellite Division of Cabot Corp. announced the development of a Ni-Co-Cr-Fe alloy which reportedly offers excellent oxidation resistance, high temperature strength, and fatigue resistance in stressed applications at temperatures up to 2000 ° F. Use of lanthanum and tantalum in the alloy, designated Haynes Development Alloy 556, is reported to improve oxidation resistance. The alloy can be machined, forged, and cold-formed by conventional methods and is intended for use in gas turbines, heat treating trays and fixtures, industrial fans, incinerators, and pollution control equipment.[5]

PRICES

The producer price of $3.75 per pound for cobalt metal granules (shot) or broken cathodes in 551-pound (250-kilogram) drums was increased to $4.00 per pound f.o.b. New York or Chicago on January 23, 1975. The price remained unchanged for the rest of the year. A weighted average price for the year was $3.98 per pound of cobalt. Reportedly, the last price change reflected a realignment of the value of the U.S. dollar with respect to the Belgian franc and did not represent an increase in the world price of cobalt as expressed in Belgian francs.

Sales of cobalt metal by the Government on a "sealed-bid" basis ranged from $3.48 to $3.75 per pound of cobalt. All prices were f.o.b. carrier's conveyance at government storage locations.

FOREIGN TRADE

Exports of unwrought cobalt metal and alloys and of waste and scrap totaled 3,133,346 pounds, gross weight, having a value of $7,037,043, and went to 22 countries. West Germany and Japan received the greatest part, with 1,215,977 pounds ($2,715,825) and 622,960 pounds ($949,443), respectively. Exports of wrought cobalt metal and alloys, 1,103,941 pounds, gross weight, having a value of $7,843,843, went to 17 countries.

Zaire, Belgium-Luxembourg, Finland, Norway, and Canada were the top five sources of imports of cobalt to the United States in 1975. Of particular note was the first import of cobalt-bearing matte from Botswana, the French Pacific Islands, and the Republic of South Africa. The material was refined at the renovated copper-nickel-cobalt refinery of Amax Inc., located in Braithwaite, La. Total imports of cobalt dropped from 16.1 million pounds in 1974 to 6.6 million pounds in 1975.

WORLD REVIEW

Supplemented by U.S. Government stockpile releases, which constituted about 47% of U.S. supply in 1975, cobalt production in market economy countries was sufficient to meet world demand in 1975. Zaire led all countries in mine production of cobalt and accounted for 53% of the total world output. The most significant cobalt developments with regard to mining and refining capacity took place in Zaire, Australia, the Philippines, Japan, and the United States. The postponement or delay of projects around the world which would have increased capacity did not create a short supply situation.

Australia.—The Greenvale nickel-cobalt project, a joint venture of Freeport Queensland Nickel, Inc. (a subsidiary of Freeport Minerals Co., of New York) and Metals Exploration, Ltd., encountered serious mechanical difficulties in May. The plant at the Greenvale site in Queensland was designed to produce 2.75 million pounds of cobalt per year in the form of mixed sulfides, and the material was slated for shipment to a new refinery of Nippon Mining Co., Ltd. in Japan. However, in June Greenvale production of cobalt had reached only about 25% of anticipated capacity; by September nearly 80% of capacity had been reached.

The project was shutdown in October for 3 weeks to resolve some of the mechanical problems. According to company officials, production of nickel-cobalt sulfides more than tripled compared with the results of the third quarter of 1975, but new problems were revealed during the break period. Other difficulties which have plagued the venture were the cost of fuel oil, wages, and the relatively low nickel price. Despite these problems, production for the year was 60% of capacity, and deferments of shipments were not requested by customers.

During the year a crisis also developed over financing of the project. To alleviate a capital shortage, new funds totaling $20 million were made available by project lenders; initial interest payments were rescheduled to March 1977; and loan repayment would not be due until March 1979.

Canada.—A 10-week strike by employees of Falconbridge Nickel Mines Ltd., had virtually no effect on the cobalt market. About 5 weeks after the strike, which began on August 21, the Norwegian refinery for the nickel-copper-cobalt matte produced by Falconbridge was still being supplied with feed material. A 3-year pact between the company and the Mine, Mill and Smelter Workers, Local 598, composed of 3,500 union members, gave the workers an immediate 90 cents per hour raise, and 20 cents per hour annual raises were provided for in the succeeding years of the contract. Also included was a cost of living escalator.

In an unrelated development, Falconbridge agreed to sell its 72.8% interest in Kilembe Copper Cobalt, Ltd., of Uganda to Rengold Mines, Ltd., of Toronto, Canada, for $2.1 million.

Cuba.—Late in 1976 or early in 1977, Cuba reportedly was to begin construction of the first of three plants to process laterite ores containing about 0.1% cobalt from a new mine located at Punta Gorda. Each plant was to have a projected capacity of 33,000 tons of nickel-cobalt ore per year. The first mining and smelting complex was scheduled for completion in 1977, and the two other plants were expected to be in operation by 1980 and 1985. In addition, Cuba planned expenditures of $40 million to modernize its Moa Bay facility.

India.—Construction of the first Indian nickel-cobalt smelter, which had been scheduled to come onstream by late 1978, was deferred. The project was postponed because of a delay in commissioning a pilot plant for the processing of laterite ore in the Kansa area.

Indonesia.—The estimated cost of the Gag Island nickel-cobalt project in Irian Barat rose to approximately $700 million. Pacific Nickel Indonesia (PNI), comprised of Sherritt Gordon, Ltd. of Canada and two other companies, requested a direct loan from the Indonesian Government and cooperation from the Government in obtaining a World Bank loan for the venture. Capacity of the proposed mine was reported as 100 million pounds per year of nickel and 4 million pounds per year of cobalt in the form of mixed sulfides.

Japan.—The new nickel-cobalt refining plants of Nippon Mining Co., Ltd. and Sumitomo Metal Mining Co., Ltd. of Japan, with a combined capacity of 2,800 tons of cobalt and 5,500 tons of nickel per year, came onstream in July after several months delay in startup. A mixed sulfide feed material derived from processed laterite ore will be supplied to the facilities from Nonoc Island in the Philippines and Greenvale, Australia. Together, these facilities are to supply 50% of Japan's refined cobalt requirements. Until recently, Japan imported most of its cobalt needs, about 4,000 tons per year, from Zambia. The Australian feed material is a mixed sulfide containing 15% cobalt and 39% nickel and was delivered to Nippon Mining Co.'s Nitachi plant, where it underwent solvent extraction. The Philippine material was mined by Marinduque Mining & Industrial Corp. and delivered to the solvent extraction plant of Sumitomo in the Minama area on Shikoku Island.

Philippines.—Marinduque Mining & Industrial Corp. twice restructured its financing during the year for the new nickel-cobalt facility on Nonoc Island. At yearend, Marinduque reportedly was attempting to reschedule principal payments of $20,400,000 due to lenders in 1976 so as to be payable over a 3-year period in quarterly installments beginning in January 1978. The refinancing is the result of production delays caused by mechanical defects and redesign requirements, as well as high fuel prices and other operating costs. Officials stated that production at the refinery was expected to reach 50% of capacity by December 31, 1975, and 80% of capacity by mid-1976. In the third quarter of the year, production at the refinery averaged about 35% of design capacity.

Zaire.—La Générales des Carriéres et des Mines du Zaire (GÉCAMINES) reportedly obtained a major loan from three sources early in the year to help finance a $435 million expansion of its copper and cobalt mining and refining capacity. The Libyan Arab Foreign Bank (LAFB), European Investment (EIB), and the World Bank provided loans totaling $220 million, with the balance to be funded by GÉCAMINES. Plans for the expansion project at Kolwezi in Central Shaba Province included the development of two new open pit mines with ancillary treatment facilities. The latter consisted of a concentrator, smelter, and refinery of 100,000-ton capacity each. During the year, GÉCAMINES also contracted for a 100,000-ton-per-year copper flash smelter at Kolwezi as part of the aforementioned expansion. The smelter was to use the Outokumpu Oy flash smelting process, which incorporates improvements piloted in Zaire and Finland.

Part of the reason for the heightened activity was that 1975 was the first year of the Zaire Government's 5-year plan. Cobalt production under the plan was to have been raised to 44.1 million pounds in 1975, but because of the general decline in demand, production only reached 38.4

million pounds. Some progress was reported on the Dikuluwe open pit mines. Ore reserves at Dikuluwe and the neighboring Mashamba ore body were put at about 1.1 billion pounds. Ore from the new mines will be transported to the new Dima concentrator at Kolwezi. When the concentrator is completed, it will be able to handle up to 4.4 million tons of ore per year. A new rail link, which carried its first train in March of 1975, will carry ore from the open pit mines to the concentrator.

The Société Miniere de Tenke Fungurume (SMTF) copper-cobalt project in Zaire reportedly was suspended in January 1976 for an indefinite length of time. According to officials, the deferment resulted from a number of factors, one of which was exceptional increase in capital costs. The project was scheduled for completion early in 1978, with an eventual production of 14.3 million pounds of cobalt per year. Reserves of cobalt were estimated to be 505 million pounds. SMTF is a consortium composed of the following companies: Standard Oil Co. (Indiana), Charter Consolidated, Ltd., Anglo American Corp. and Rand Selection Corp., Ltd., French interests, Leon Tempelsman & Son, Inc., and the Zaire Government.

The main reasons for suspension of the project reportedly were (1) the relatively low copper price; (2) cost inflation (capital costs rose to an estimated $800 million); (3) doubts over power availability; (4) closure of the Benguela railway; and (5) the general uncertainty in central Africa generated by the civil war in Angola.

Zambia.—Transportation problems continued to impede shipments of copper and cobalt from Zambia. At one time during the year, cobalt was being shipped by air to European clients. This operation was made profitable by the relatively high price of cobalt on the world market and reduced air transport fees. The principal transportation problem in the country was lack of road transport. The Chinese-built Tanzam railway, which had lessened the strain on the road transport system, was not expected to be entirely completed before 1978. The outlets being used in 1975 were mainly Dar Es Salaam in Tanzania and Luanda in Angola until the latter part of the year.

[1] In addition to the countries listed, Bulgaria, Cyprus, East Germany, Greece, Poland, the Republic of South Africa, Spain, Sweden, and Uganda are known to produce ore (copper, nickel, and/or pyrite) that contain recoverable quantities of cobalt, but available information is inadequate to make reliable estimates of output levels. Other nations may also produce cobalt as a byproduct component of ores and concentrates of other metals.

[2] In addition to the countries listed, the United Kingdom recovers cobalt metal from intermediate metallurgical products produced in Canada, but data on output are inseparable from the total reported by Canadian producers. Czechoslovakia presumably recovers cobalt from materials imported from Cuba, but data are inadequate to estimate output. Belgium and Japan, both of which import substantial quantities of crude materials containing cobalt, have not recorded output in recent years but are producing metal and/or cobalt compounds. Poland also apparently processes cobalt-bearing copper ores, but no data on cobalt recovery are available.

[3] Actual output not reported. Data presented for mine output are total cobalt content of all products, including nickel oxide sinter shipped to the United Kingdom for further processing and nickel-copper matte shipped to Norway for further processing. Data presented for metal output are total cobalt content of all products less cobalt output recorded for Norway. Thus, the metal data include cobalt content of oxides and other compounds that are not produced as metal and total metal output in the United Kingdom as well as actual metal output in Canada itself.

[4] Domestic mine output, if any, is negligible.

[5] Produced entirely from nickel-cobalt matte from Canada; domestic mine output is recovered abroad.

[6] Insufficient data are available to permit separate estimates for mine and metal production.

TECHNOLOGY

Bureau of Mines researchers continued work on a low cost rare-earth cobalt permanent magnet. Using mischmetal-cobalt magnets with addition of an optimum quantity of selected elements, the researchers hope to approach the properties of currently available samarium-bearing magnets.

A new production process for rare earth-cobalt alloy powders developed and patented in West Germany by Th. Goldschmidt AG is based on the calciothermic reduction of oxide starting materials. Mixtures of oxides and metal powders are converted in the presence of calcium vapor into a fine-grained alloy powder and calcium oxide. The reaction product is then crushed; the calcium oxide is separated from the alloy by wet chemical methods; and the alloy powder is dried in vacuum. Reportedly, the process can be adapted to make alloys of any rare-earth mixture as well as alloys varying from the 1:5 stoichiometry of $SmCo_5$.

A range of polymer-bonded cobalt-rare earth permanent magnet materials reportedly now being produced uses simplified manufacturing techniques of plastic molding technology. The development of these new materials could signal a revolution in the use of miniature magnets. Advantages and properties of the magnet material include (1) the possibility of producing a wide variety of shapes; (2) good resistance to chipping; and (3) high maximum energy product leading to significant size reductions. Among the possible applications are miniaturized permanent magnet motors, phonograph pickups, and miniature transducers.[6]

---

[6] Work cited in footnote 3.

Through investigations, researchers at the University of Notre Dame and elsewhere were gaining greater insight into the phenomenon of magnetostriction, which is the change in dimension of a ferromagnetic body when a magnetic field is applied. The researchers reportedly were tabulating the properties of 15 rare-earth cobalt alloy magnets, some of which are more powerful than conventional Alnico types. From the data, engineers may be able to select the best magnetostrictive device for a given task. Potential applications for magnetostriction are testing and monitoring of materials in a working jet engine or in a hot nuclear reactor.[7]

A silicon-carbide composite material that could someday reduce cobalt consumption in its major application in superalloys for jet engines reportedly was successfully flight tested during the year. The composite ceramic material, made from silicon carbide-coated boron filaments, is being fabricated as jet engine fan blades. The leading edges of the finished blades are coated with nickel and cobalt for protection. According to one official involved in the testing, maximum use of the ceramic material could provide a 15% to 20% weight savings in jet engines.[8]

Two Japanese companies, Marubeni America Corporation and Mifuji Iron Works Co., have undertaken a research and development program to recover cobalt and other metals from spent catalysts used in oil refineries and petrochemical plants. A pilot plant with a capacity to process 528 pounds of spent catalysts per day was scheduled for completion in September 1976. Development of the necessary technology was expected to be completed by March of 1976. By the end of 1977, the companies plan to have a commercial facility completed with an annual capacity for processing 20,000 tons of various catalysts. Presently in Japan, spent catalysts from oil and petrochemical plants are buried underground or returned to suppliers.[9]

Bureau of Mines researchers released a report on a technique to recover nickel and cobalt from domestic laterites. The report states that recovery can be effected by selective reduction of laterites at 350° to 600°C with carbon monoxide in a solution of ammonium sulfate, ammonia, and oxygen; cobalt and nickel are then leached from the resulting product. Nickel is selectively recovered from the leach liquor by solvent extraction, after which it is stripped from the organic phase with dilute sulfuric acid, and finally it is reduced electrolytically.[10]

A process was patented whereby oxide and silicate nickel ores could be processed to recover copper, nickel, cobalt, and magnesium. In the process, several batches of ore are leached with sulfuric acid until the magnesium content of the leach liquor becomes excessive. Excess ore is added to precipitate iron, and then copper is selectively precipitated from the leach liquor. Magnesium is later removed from the cobalt-nickel bearing liquor as magnesium hydroxide.[11]

Early in the year, International Nickel Co. Inc. patented a process for the continuous recovery of nickel and cobalt from oxide ore. Ore is preheated to 850° to 1,100° C and mixed with calcium chloride or sodium chloride and coal or coke. The mixture is heated to 900° to 1,100° in a hydrogen atmosphere. Combustion gas flow from a burning fuel is minimized to produce metallized nickel-cobalt particles.[12]

Three patents were obtained by Deepsea Ventures, Inc. in 1975 for the extraction of cobalt and other valuable metals from manganese nodules.

In the first method, nodules are leached in an aqueous solution of sulfuric acid and sodium chloride and heated to vaporize the values as chlorides. The vapors are then converted to an aqueous solution from which insoluble iron oxide is removed. The low-iron aqueous solution is contacted with a liquid ion exchange resin and the separate strip solutions are subjected to electrolysis.[13]

By a second method, an aqueous solution of ground nodules is treated with ferric chloride to form metal chlorides in the solution along with solid ferric oxides.

The ferric oxide is separated from the solution and treated with hydrogen chloride to regenerate ferric chloride for recycling, and the pregnant solution is subjected to solvent extraction procedures to recover metal values.[14]

In the third method, nickel and cobalt are recovered from a solution obtained by leaching nodules with hydrochloric acid. The leach liquor is adjusted to a pH value of 3 to 6 and contacted with an organic solution to selectively extract nickel and cobalt. The loaded extracting solution is stripped of nickel with an aqueous acid and the liquor is then stripped of cobalt at a hydrogen ion concentration of at least 6 normal.[15]

Coke and Coal Chemicals

By Franklin D. Cooper[1]

Production of coal coke in the United States in 1975 was 7.1% less than in 1974, principally because of a 16.7% decrease in production of pig iron and ferroalloys in blast furnaces. Also contributing to the decrease were a 22.8% reduction in shipments of foundry coke and a 24.8% decrease in the tonnage of coke shipped to other industrial plants.

Production remained relatively constant throughout the year and averaged 4.77 million tons per month. The average daily output from all slot-type and beehive plants ranged from a low of 144,000 tons in September to a high of 174,000 tons in March. Average daily total output in 1975 averaged 157,000 tons.

During the year the demand for coke was less than production. Producers' stocks of oven coke at 5.00 million tons were 4.06 million tons greater at yearend than 1 year earlier.

Blast furnaces continued to use the major portion of the Nation's coke production, receiving 93.4% of the 53.15 million tons of coke distributed by producers. The consumption of coke per ton of hot metal produced at blast furnaces averaged 1,222 pounds, compared with 1,219 pounds in 1974.

The coke equivalent of fuels injected through blast furnace tuyeres amounted to 98 pounds of coke equivalent (at 13,000 British thermal units (Btu) per pound) per ton of hot metal, compared with 104 pounds in 1974.

Breeze production per ton of coal coked averaged 114.6 pounds because of reportedly extended coking times and the slightly reduced use of low-volatile coals in the mixtures carbonized. Breeze is unsuitable for almost all metallurgical applications because of its small size and high volatile and ash contents. The larger part of the breeze production was used by producers for sintering iron-bearing dust and ores. However, 36.6% of the output was sold for industrial uses other than as fuel for steam plants or in agglomerating plants. The tonnage of breeze sold was 15.5% less than in 1974 and brought an average of $32.21 per ton, up from $17.83 in 1974.

The average cost of all bituminous coals and anthracite carbonized in slot ovens increased $7.72 per short ton to $44.21 per short ton. This increase was reflected in the average value of coal per ton of coke, which increased $11.16 per short ton to $64.55 per ton. The largest price increases occurred in foundry coke sales. Foundry coke prices, which averaged $106.52 per ton, f.o.b. plant, were $27.60 per ton higher than in 1974.

The production of tars, ammonia, crude light oil, and coke-oven gas decreased because less coal was carbonized.

Foreign trade was notably reduced with coke exports at 1.27 million tons equal to 2.2% of domestic production. About 85% of the exported coke went to Canada, the Netherlands, West Germany, and Mexico. Coke imports were 48.6% less than in 1974, and exports were down 0.4%.

The total value of all coals carbonized was $3,645.7 million, and the total value of all carbonization products was $5,261.3 million. The combined value of coke and breeze, the principal products, accounted for 87.5% of the total value of all products.

COKE AND BREEZE

DOMESTIC PRODUCTION

A 16.7% decrease in the production of pig iron and ferroalloys in 1975 largely accounted for a 13.3% decrease in the demand for blast furnace coke. Output of oven coke plus beehive coke averaged 4.77 million tons per month, with 4.31 million tons produced in September and 5.39 million tons in March. Daily production for the year averaged 157,000 tons, down 7.1% from the average daily output of 1974.

Forty-eight furnace plants produced 91.7% of the oven coke. These plants, owned by or financially affiliated with iron and steel companies, were operated mainly to produce coke for iron blast furnaces. The remaining oven coke was produced by 14 merchant plants, who sold blast furnace, foundry, and other grades of coke on the open market.

Coke was produced in 19 States in 1975. The relative amounts of coke produced in the various States have changed little in the past decade. Because coke is used principally as a fuel and reducing agent in blast furnaces, the coke industry is concentrated in the major steel-producing areas of the Eastern and North-Central States. The bulk of the 1975 output came from 14 States east of the Mississippi River. Six States west of the river produced 7.7% of the total production. Pennsylvania, the largest producer, accounted for 27.1% of the output, followed by Indiana and Ohio. These three States accounted for 58.6% of the national output.

An average of 1,367 pounds of breeze-free coke was produced for each ton of coal carbonized in the United States in 1975. The 1975 yield of coke, which averaged 68.4%, has remained nearly constant during the past decade.

The term "coke breeze" generally refers to a mixture of carbonized bony coal, slaty rock, and coke particles passing through a ½-inch-square screen. More than 28% of the 1975 breeze production was used as fuel in agglomerating plants. The remainder was used in steam plants and in the production of elemental phosphorus from phosphate rock. The amount of breeze sold has increased significantly in recent years; about 45.6% of the 1975 production was sold.

The breeze yield per ton of coal carbonized is influenced by oven operating practices, the types of coals used, and the degree of pulverization of coal mixtures carbonized. The lowest yield of 2.83% was attained in Pennsylvania, while Illinois had the highest yield at 8.13%. At 5.21%, the national yield has not varied significantly during the past decade.

Oven-coke plants averaged 104.2 pounds of breeze produced per ton of coal carbonized. The yields at beehive-coke plants were substantially higher than those at oven plants, but beehive breeze production was negligible because only a few plants had recovery facilities.

Based on information derived from a variety of sources, the current total capacity of U.S. slot-type coke plants is approximately 200,000 tons per day. At this time, there are 231 coke batteries in the United States consisting of 13,224 slot ovens, each of which averages approximately 5,500 tons per year of coke production and which collectively have a theoretical maximum annual capacity of 74.4 million tons based on 365 days per year, 18 hours coking time for furnace coke, and 30 hours for foundry coke. Industry considers the normal life span of a coke-oven battery as 25 to 30 years. About 10% of the current capacity is less than 5 years old. Trade journals report that about 9 million tons of productive capacity is under construction.

Construction work in progress in 1975 on new coke-oven batteries included the No. 1 battery at Bethlehem Steel Corp.'s Northhampton works; a 56-oven battery at Jones & Laughlin Steel Corp.'s Aliquippa works; a 13-foot high, 85-oven, 1,500-ton-per-day-capacity battery of ovens at Republic Steel Corp.'s Cleveland works; and two batteries at United States Steel Corp.'s Gary works, one of which was scheduled to start operation in 1976.

Rehabilitation underway in 1975 included work on one 45-oven battery of the International Harvester Co., Chicago, Ill.; on two 106-oven batteries at Jones & Laughlin Steel Corp.'s Aliquippa works; on one 79-oven and three 59-oven batteries at Jones & Laughlin Steel Corp.'s Pittsburgh works; on the "C" battery of National Steel Corp., Granite City, Ill.; and on two batteries at United States Steel Corp.'s Clairton works.

Salem Corp.'s subsidiary, the Wilputte Corp., received a $40 million contract from Algoma Steel Corp., Ltd., Sault Ste. Marie, Ontario, for a turnkey coke plant. The contract included a Wilputte-designed battery consisting of 60, 5-meter high, underjet, regenerative, low-differential coke ovens suitable for carbonizing mixtures of high- and low-volatile coals. The contract contained provisions for air pollution control devices and additional measures for the possible future installation of a Coaltek system. Completion of the contract was scheduled for the last quarter of 1977. Wilputte also received a contract in late June 1975 to build a coke plant for Republic Steel Corp. at Gadsden, Ala. Reportedly, the new battery of 85 coke ovens plus coal- and coke-handling equipment and certain coal chemical facilities would cost $75 million to $80 million.

Arthur G. McKee & Co., Cleveland, Ohio, in a joint venture with Dr. C. Otto and Comp. GmbH of Bochum, West Germany, received an order from Youngstown Sheet & Tube Co., a division of Lykes-Youngstown Corp., for a multimillion-dollar coke-oven plant and ancillary facilities to be built at the company's Indiana Harbor works in East Chicago, Ind. The turnkey project will include a coke battery of 85 large-capacity Otto ovens designed for a maximum coal throughput of 4,900 short tons per day, a 2.65-million-standard cubic feet per hour coke-oven gas purification plant, equipment for gas cooling and tar separation, recovery equipment for ammonia, benzol, and naphthalene, gas exhausters, and extensive facilities for the preparation and handling of coal and coke.

Armco Steel Corp.'s two new coke batteries, at Middletown, Ohio, each comprising 57 ovens (coal capacity, 32 tons), were scheduled for startup in mid-1976. Total bricklaying effort was about 41% complete as of July 1975. The two batteries and related facilities will produce 112,750 tons per month of blast furnace coke at a coking rate of 1.05 inch per hour from 165,000 tons of mixed high- and low-volatile coals. In addition to the 56 million cubic feet per day of coke-oven gas produced, other byproducts will include 44,000 gallons of tar, 36 tons of sulfuric acid, 13 tons of anhydrous ammonia, 12,000 gallons of benzene, 1,700 gallons of toluene, and 275 gallons of xylenes.

The Koppers Co. was constructing a 79-oven battery for the Wheeling-Pittsburg Steel Corp. at Follansbee, W. Va. About 20,000 tons of refractories, roughly equivalent to 6.5 million 9-inch brick, will be required to construct the 20-foot-high ovens. Related pollution control equipment will include a hooded coke guide connected to a fume-collecting main and scrubber, a screw-type feed system on larry cars, smoke-collecting hoods on leveler bars, a mechanical door and jam-cleaning device, and a double collecting main on the coke battery.

The East Chicago Department of Air Quality Control in early May 1975 granted Inland Steel Co. permission to operate its old "B" coke battery for another year, until the new "C" battery could be partially redesigned and improved. Inland Steel Co. spokesmen reported that substantial problems in both design and operation of its new smokeless coke battery had limited the "C" battery to about 60% of its planned coke production. Koppers Co., builder of the 56-oven "C" battery that was put into operation in the summer of 1974, had a crew at the site attempting to solve the problems.

Construction started in May 1975 on a 7,000-ton-per-day blast furnace and a "smokeless" 20-foot-high, 69-oven coke battery rated at 3,000 tons of coal per day at the Indiana Harbor works of Inland Steel Co.

CONSUMPTION AND SALES

Apparent consumption of coke in the United States totaled 53.69 million tons. This quantity (domestic production plus imports, minus exports and changes in stocks) was 10.40 million tons less than consumed in 1974. The decrease was attributed to a significantly smaller demand for blast furnace coke, caused by a 16-million-ton decrease in blast furnace pig iron and ferroalloy production.

The amount of breeze-free coke consumed by blast furnaces in producing 1 ton of hot metal increased from 1,219 pounds in 1974 to 1,222 pounds in 1975.

In 1956, 1,720 pounds of coke were consumed per ton of hot metal produced by blast furnaces. Current consumption, about 500 pounds less than 2 decades ago, decreased as a result of the use of increased quantities of iron concentrates, oxygen, and supplemental fuels.

Although a variety of operating practices affect blast furnace coke rates, the 4-pound increase in the coke rate was accompanied by a 6-pound coke-equivalent decrease of supplemental fuels, excluding coal, injected through blast furnace tuyeres per ton of hot metal produced. The supplemental fuels were principally fuel oil, coal tar and pitch, natural gas, and coke-oven gas. Although the units of measurement differ, and the quantity of each fuel used varies, the total calorific value of all supplemental fuels consumed in blast furnaces in 1975 was equivalent to 3.9 million tons of coke. Oxygen consumption in blast furnaces equaled 25,923 million cubic feet, 0.4% more than in 1974. The use of oxygen reduces the blast furnace coke requirement by making available more sensible heat during the reduction of iron ore to pig iron.

Of the 53.15 million tons of oven and beehive coke distributed for all purposes in 1975, 49.62 million tons, including 1.27 million tons exported, went to blast furnaces; 2.61 million tons went to foundries; 0.92 million tons went to other industrial purposes. Producing companies produced 46.23 million tons of blast furnace coke for use in their own blast furnaces. Merchant plants produced 2.68 million tons of blast furnace coke that was sold to blast furnace plants.

Merchant plants produced 4.72 million tons of coke, 90.9% of which was sold on the open market. Principal markets were blast furnaces not associated with integrated coke-producing facilities, independent gray-iron foundries, nonferrous smelters, and chemical plants. Some of the merchant coke was used by its producers, principally in chemical plants and affiliated foundries. Essentially all of the coke distributed by beehive plants was sold for blast furnace use.

All States except Alaska, Delaware, Hawaii, Nevada, New Hampshire, South Dakota, and Vermont received shipments of coke or breeze in 1975. Alabama, Illinois, Indiana, Maryland, Michigan, New York, Ohio, Pennsylvania, and West Virginia, which were the major iron- and steel-producing States, received 88.8% of the total coke and 81.8% of the total breeze distributed.

The bulk of the distributed coke was blast furnace coke that was consumed within the producing State, since most blast furnaces were integrated with coke ovens. A few companies shipped coke to affiliated blast furnaces in other States.

About 5.0% of the breeze-free coke distributed was shipped to foundries. The chief consumers of foundry coke were the automotive, farm-machinery, machine-tool, heavy-machinery, railroad, and electrical equipment industries. Most of these industries were located in the Eastern and Midwestern States. The combined receipts of Alabama, Illinois, Indiana, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Wisconsin, accounted for 74.8% of the foundry coke shipments. Foundry coke was shipped to 38 States.

Other industrial coke was used in 34 States for miscellaneous applications. The principal consumers were nonferrous smelters, and plants manufacturing sugar, mineral wool, alkalis, calcium carbide, and elemental phosphorus. Alabama, Missouri, Ohio, Pennsylvania and Texas received 49.8% of the shipments of other industrial coke.

STOCKS

Yearend stocks of slot-oven coke were 434% more than at yearend 1974 as the quantity of coke in stock increased by 4.06 million tons during 1975. Oven-coke plants ended the year with stocks equal to 34 days' production at the December 1975 rate. Normally, beehive plants do not stock coke.

The bulk of the stock, 94.4%, was at furnace plants, which roughly had a 33-day supply compared with a 21-day supply at merchant plants.

Because steel producers operating coke-oven batteries also produce gas for their mills, coke stocks increased awaiting an anticipated turnaround in steel demand.

Stocks of coke breeze at producers' plants increased 17.8% during 1975. Approximately 78.5% of the breeze in stocks was at furnace plants.

Despite more than adequate inventories, an upturn in world coke trade and price was foreseen because of the Government's mandating further coke-oven shutdowns in the United States. As a hedge against this possibility, the prediction was that the U.S. buyers would augment coke inventories by foreign purchases.

VALUE AND PRICE

The average value of receipts of all grades of oven coke reached $87.64, up $21.90 per ton, and beehive coke averaged $65.17, up $21.15 per ton. The 1975 average values represented increases of 33.3% for oven coke and 48.1% for beehive coke.

For oven coke, an increase of 35.0% raised the average price of foundry coke sales to $106.52 per ton; commercial sales to blast furnaces increased an average of 38.2% to $73.67 per ton. Oven coke used for other industrial purposes increased 29.8% in price to $77.02 per ton.

The differential between the average price of blast furnace and foundry oven coke is attributed to the special specifications for foundry coke that make it a more costly product having superior properties, resulting from long coking times at lower temperatures of coal mixtures containing up to 50 weight-percent low-volatile coal and occasionally petroleum coke and anthracite. The difference in the average values of oven and beehive cokes is partially due to the additional transportation costs of coal delivered to oven-coke plants and the substantial investment and maintenance costs of slot-type ovens.

The average price of foundry coke in the United States remained constant throughout much of 1975, with none of the six Bureau of Labor Statistics' sample cities showing any deviation for the final 4 months of the year. Prices in Indianapolis and Birmingham remained unchanged for the entire 12 months. In August, producers of foundry coke in Milwaukee, Wis., and Painesville, Ohio, dropped the price from $115.00 to $112.50 per short ton; Neville Island increased the price from $110 to $117 per short ton.

The price of domestic blast furnace coke remained firm in the range of $71.00 to $74.50 per short ton delivered.

FOREIGN TRADE

Foreign trade in coke was comparatively slower than in 1974. Exports at 1,272,906 short tons, 4,775 tons less than in 1974, amounted to 2.2% of total production. Approximately 84.7% of the total coke exported to more than 21 countries went to Canada, Mexico, the Netherlands, and West Germany at an average price of $55.85 per short ton. Exports from Buffalo, N.Y., Detroit, Mich., Norfolk, Va., and Philadelphia, Pa., totaled 943,542 tons at an average price of $53.49 per ton. Total exports averaged $58.71 per ton, or $24.62 per ton more than in 1974. Canada received 680,595 tons, or 53.5% of the total exports. Exports to Canada averaged $56.46 per ton.

Imports of coke totaled 1,818,981 short tons and averaged $86.03 per ton, compared with 3,540,326 tons imported in 1974 at $54.56 per ton.

Canada, the Netherlands, the Republic of South Africa, and West Germany together shipped 1,695,166 tons at $86.10 per ton to the United States. West Germany shipped 1,387,755 tons, averaging $88.71 per ton.

Baltimore, Md., Detroit, Mich., New Orleans, La., and Philadelphia, Pa., were the major ports of entry for 1,451,068 tons having an average price of $85.55 per ton.

COKING COALS

QUANTITY AND VALUE OF COAL CARBONIZED

A total of 83.3 million tons of bituminous coal was carbonized at high temperatures for the production of coke in slot-type and beehive ovens. This quantity, equaling 12.8% of the 1975 U.S. bituminous coal production, was the second largest coal market. In addition to bituminous coal, 326,000 tons, or approximately 5.3% of the U.S. anthracite production, was used in the coal blends carbonized. Anthracite was used principally in the production of foundry coke to achieve greater size and density, desirable properties in the operation of foundry cupolas.

The average delivered value of all coal and anthracite carbonized by oven-coke plants was $44.21 per ton. The average value of coal carbonized by beehive-coke plants cannot be published because of individual company confidentiality. Transportation costs account for the high value of the coal consumed by oven-coke plants in some States. Such costs often exceed the value of the coal at the mine.

The average value per ton of coal carbonized at oven-coke plants was 21.2% greater than in 1974. Coals delivered to all consuming States had increases in average value per ton ranging up to 34.1%. The highest coal price was recorded for Maryland and New York, where the value of coal carbonized averaged $57.27 per ton.

An overall average of 1.46 tons of coal, valued at $64.55, was required for each ton of oven coke produced. Beehive ovens required an average of 1.58 tons of coal per ton of coke output.

By early June 1975, several coal companies began slowing the production of "marginal quality" metallurgical coal. Normally, steel plants would not use such coal for coke production. However, some coals of this type were used during the period of high steel production in 1974 in the effort to increase blast furnace coke inventories.

Consolidation Coal Co. shortened work schedules at its metallurgical coal mines to 5 days a week from 6 days as slumping steel demand began affecting the coal industry. Bethlehem Steel Corp. shut down its Mine No. 45 in Jeffrey, Boone County, W. Va. This mine had been producing about 100,000 tons of metallurgical coal annually.

United States Steel Corp. planned to boost metallurgical coal production from its mines over the next several years, partly by opening new mines. The 1975 output was targeted to reach 18.5 million tons, up 12.8% from the 1974 actual output of 16.4 million tons. However, unauthorized work stoppages in the third quarter significantly decreased the estimate for the second half of 1975.

New United States Steel Corp. mines that eventually will produce much of the firm's coal are the Dilworth mine in southwestern Pennsylvania, the Oak Grove mine near Hueytown, Ala., the No. 37 mine in the Lynch district of Kentucky, and areas having less favorable mining conditions in the Robena mines complex in southwestern Pennsylvania and in the No. 10 mine at Gary, W. Va.

BLENDING

It is difficult to define a "good coking coal." Gradually the use of the word "good" is being replaced by "satisfactory." Satisfactory means that a coal or blend of coals produces a coke which, in turn, permits a blast furnace practice fully competitive in quality, efficiency, and cost. It is only rarely that a single coal is available for making a satisfactory coke; blending of two or more coals of different properties is the rule at a majority of coke plants. While a simple two-coal blend of high- and low-volatile coals is most common, there are cases in which the use of a third coal or other blending material is advantageous. Coal tar pitch, petroleum coke, coke breeze, and other carbonaceous materials have been tried and in some cases have been used commercially with success.

The terms "low-", "medium-", and "high-volatile coking coals" do not designate sharply defined classes. These terms are used by slot-oven operators in a relative sense, and the exact meanings intended by the individual operator may vary somewhat with the behavior of the coals with which he is most acquainted, or which are available for his plant.

The term "low-volatile coal" is used in this discussion to designate coals of 14% to 22% volatile matter, such as the Pocahontas and New River, W. Va., and Somerset County, Pa., type. For byproduct oven use, such coals are mixed with high-volatile coking coals in any proportion up to 60% or more (but usually from 10% to 30%) in order to increase the size and strength of the coke. This practice increases the coke yield and decreases the byproduct yields. Most slot-oven operators prefer low-volatile coals having a volatile matter content of about 16% to 18% (dry basis), although a considerable quantity of coal that does not come within this range is used. Low-volatile coals are not charged in an unmixed condition into slot ovens because they expand when coked.

The Bureau defines medium-volatile coking coals as those having 22% to 31% volatile matter, dry basis. Such coals have certain coking characteristics that differentiate them from coals having distinctly higher or lower volatile-matter content. Medium-volatile coals, when coked without admixture, nearly always produce large blocky cokes having highly desirable general physical characteristics. Many medium-volatile coals, particularly those having less than 24% to 25% volatile matter, are practically nonshrinking, or even slightly expanding under many operating conditions, in which cases the coke would be difficult or impossible to push from the slot oven.

The largest portion of the tonnage of all coals charged into slot ovens exceeds 31% volatile matter, dry basis, and is designated high-volatile coal by the Bureau. High-volatile coking coal is produced from many seams in many States. Because high-volatile coals when carb[illegible]zed alone produce lower yields of weaker and smaller sized coke, many plants producing blast furnace coke add low- or medium-volatile coals to high-volatile coals to the extent of 10% to 30% of the weight of coal mixtures charged into the slot-type ovens. The use of anthracite imparts increased size and density, and the use of tar pitch in the coal mix increases the coke strength.

Blending also permits the use of some high-sulfur-content coals in admixture with low-sulfur coals so that the coke has an acceptable sulfur content.

The overall percentages of high-, medium-, and low-volatile coals in the mixtures carbonized have varied little in the past decade, although there are wide variations in the proportions used at individual plants. Coke plants in West Virginia and the Western States used the largest percentages of high-volatile coals in their blends, but plants in Minnesota and Wisconsin used the largest percentages of low-volatile coals. Compared with furnace plants, some merchant plants used approximately 50% of low-volatile coals in mixtures carbonized at lower temperatures during a longer coking time to produce foundry coke.

The types of coals used in each plant are determined by the availability of the desired coal, the moisture content, the ash-fusion temperature, the volatile matter content, the expansive properties, the delivered cost, the storage characteristics, the free-swelling index, and the physical and chemical properties of the coke product.

SOURCES OF COAL

Of the 26 States that produced bituminous coal in 1975, the 13 States that shipped coal to coke plants supplied 84.7 million tons of coal for coking. West Germany and Canada exported a total of 136,000 tons of coal for use in U.S. coke plants.

Of the coals received by oven-coke plants, 76.1% was produced in West Virginia, east Kentucky, and Pennsylvania. West Virginia shipments comprised low-volatile coals mainly from McDowell, Raleigh, and Wyoming Counties and medium-volatile coals mainly from McDowell and Raleigh Counties. Pennsylvania supplied high-volatile coals mainly from Allegheny, Greene, Washington and Westmoreland Counties and low-volatile coals mainly from Cambria and Somerset Counties. Pennsylvania and West Virginia coals were widely distributed and used in many of the coke-producing States. East Kentucky supplied 14.3% of the shipments to coke plants, all of which comprised high-volatile coals produced mainly in Floyd, Harlan, Letcher, and Pike Counties.

Illinois produced high-volatile coking coals, principally in Franklin and Jefferson Counties; other States with substantial production were Alabama, Colorado, Utah, and Virginia. Most of the coal produced in these States was used within the State. Colorado, New Mexico, and Utah, however, supplied most of the coals that were carbonized in California.

CAPTIVE COAL

About 53.6% of the coal received by all slot-oven plants was produced by company-owned or affiliated mines. Ordinarily, this captive coal does not enter commercial channels. In 1975, 56.5% of the coal received by furnace-coke plants was captive. Some merchant plants also owned coal mines, but only 18.5% of the coal received was captive production.

STOCKS

Stocks of bituminous coal at slot-oven plants ranged from 7.00 million tons to 10.01 million tons, equal respectively to 31 and 44 days' consumption at the yearly daily average of 225,000 tons. Bituminous coal stocks reached their highest yearly level during June, when month-end quantities totaled 10.01 million tons. The lowest level, 7.00 million tons, was reported at the end of September.

Bituminous coal stocks at the end of 1975 were 8.67 million tons, compared with 6.04 million tons when the year began. The 8.67 million tons in stock at all slot-oven plants at yearend was equal to a 39-day supply at the December 1975 rate of consumption.

Stocks of anthracite at yearend totaled 126,000 tons, equal to a 141-day supply at the 1975 average rate of consumption.

COAL CHEMICALS

The term "coal chemicals" refers to the refined materials recovered from crude liquids obtained from the gases and vapors released during coal carbonization. Three materials—ammonia, tar, and light oil—are normally recovered at slot-oven plants using condensation and absorption processes. The remaining noncondensible material, which is rich in hydrogen and methane, is called coke-oven gas. Except for ammonia, which is recovered as an aqueous solution or converted to ammonium sulfate or phosphate and sold as produced, the materials are in most instances further processed to yield a number of primary organic chemicals or chemical mixtures, the most important of which are benzene, toluene, xylenes, solvent naphtha, crude chemical oil (better known as carbolic oil), and pitch. Although many slot-oven plants in the United States are equipped to process tar and crude light oil, the extent to which such equipment is utilized depends upon economic conditions and tonnage of coal carbonized because yields of various chemicals are low.

Yields of chemicals vary with the kinds of coals carbonized, carbonizing temperatures, and operating techniques and equipment, but about 315 pounds of coke-oven gas, 90 pounds of tar, 20 pounds of crude light oil, and 5 pounds of ammonia can be recovered for each short ton of coal carbonized. In standard units of measure, these quantities amount to about 10,500 standard cubic feet of coke oven gas, 10 gallons of tar, and 3 gallons of crude light oil. Ammonia expressed as ammonium sulfate equivalent was recovered at an average rate of 17 pounds per ton of coal carbonized in those 51 plants employing recovery processes.

In terms of calorific value the products, excluding coke, recovered at oven-coke plants in 1975 totaled 602.3 trillion-Btu. This quantity was roughly equivalent to 30% of the heating value of the coal carbonized.

COKE-OVEN AMMONIA

Coal carbonized at high temperatures releases nitrogen and hydrogen, portions of which combine to produce ammonia. Ammonia must be removed from coke-oven gas to reduce t[illegible] subsequent formation of corrosive comp[illegible]ds with oxygen, hydrogen sulfide, and hydrogen cyanide. Coke-plant operators normally recover ammonia as an aqueous solution or as ammonium sulfate or phosphate. However, 11 plants did not recover ammonia as a salable product in 1975.

Production of ammonia decreased 10.8%, although the number of recovery plants increased by five. The average value per ton of both ammonia liquor and ammonium sulfate increased, although the total value of sales decreased 11.9%. Ammonia products sold in 1975 represented 5.8% of the total value of all coal-chemical sales.

Wilputte Corp. announced in May that it had been awarded a contract to furnish necessary engineering services to prepare design and detail drawings for two ammonia stills and auxiliaries to be installed at the Sparrows Point, Md., coke plant of Bethlehem Steel Corp. The installation of these units will be part of the system being installed by Bethlehem for controlling the discharge of effluents from the coke plant. The facility will be erected by Bethlehem Steel Corp. and was expected to be operational by mid-1976.

COKE-OVEN GAS

The fixed gases resulting from the carbonization of coal have a gross heating value ranging from 520 to 600 Btu per standard cubic foot, and are principally used for heating coke ovens and steel- and allied-plant furnaces. Small volumes were sold for distribution through city mains and for minor industrial uses. Gas yields vary among plants, but the average quantity produced for each ton of coal carbonized in all slot ovens was 10,860 cubic feet, compared with the average yield of 10,890 cubic feet for 1974. The total gas production decreased 7.4% because 7.2% less tonnage of coal was carbonized in 1975.

About 39.6% of the coke-oven gas produced was used for heating ovens. Most of the remainder of the production was used by coke producers to fuel boilers or transferred to steel or allied plants to heat open-hearth and other metallurgical furnaces. A small part of the gas produced was flared in situations where production exceeded demand.

Although coke-oven gas was the principal fuel used to heat coke ovens in 1975, some ovens were heated by a mixture of coke-oven and blast furnace gas, or a mixture of blast furnace and natural gas. A total of 393.7 billion cubic feet of coke-oven gas equivalent was so consumed, of which about 90.0% was coke-oven gas.

Surplus coke-oven gas used and sold in 1975 was valued at $29.27 million, a 2.1% decrease from the 1974 value. No value was reported by producers for the coke-oven gas used to heat their ovens, but by applying the average value of $0.555 per thousand cubic feet reported for surplus gas to the gas used for underfiring, the total value of all coke oven gas used and sold in 1975 would be $296.8 million.

The so-called Sulfiban process developed jointly by Bethlehem Steel Corp. and B S & B Process Systems of Houston, Tex., was being installed at the corporation's Bethlehem, Pa., works to remove H_2S from coke-oven gas. The process, which reduces ethanolamine consumption, requires no catalyst or specialized equipment. Instead, ammonia injected into the sour coke-oven gas reacts with thiocyanates that form in the absorption fluid and which inhibit the absorption of sulfurous components. Urea formed in the reaction between thiocyanates and ammonia decomposes in the heated stripper reboiler, where rich ethanolamine solution is freed of H_2S before being recycled as lean absorption fluid. Some of the ammonia, which is also liberated, is recovered in a condenser and recycled to the lean ethanolamine solution going to the absorber.

The importance of the purification of coke-oven gas was clarified.[2]

Massey and Dunlap presented operating details and installed capital and net amortization and operating costs for four coke oven gas desulfurization processes—the Koppers two-stage vacuum carbonate process, the Dravo-Firma Carl Still process, Sulfiban process, and the Stretford process with effluent treatment.[3]

Singleton and Batterton offered operating data on a pilot plant used to demonstrate the Sulfiban process employing aqueous monoethanolamine as an absorbent that is thermally regenerated.[4]

[3] Massey, M. J., and R. W. Dunlap. Assessment of Technologies for the Desulfurization of Coke Oven Gas. AIME Ironmaking Proc., v. 34, 1975, pp. 583–603.

An inventory of North American coke oven gas desulfurization plants, presumably as of mid-1975, follows:

Company	Location	Gas production	Process
Plants in operation:			
Bethlehem Steel Corp	Burns Harbor, Ind	120	Vacuum Carbonate/Claus.
	Lackawanna, N.Y	50	Do.
	Sparrows Point, Md	100	Vacuum Carbonate.
Dominion Foundry & Steel Ltd. (DOFASCO).	Hamilton, Ontario	42	Stretford.
Donner Hanna Coke Corp	Buffalo, N.Y	30	Vacuum Carbonate.
Inland Steel Co	Indiana Harbor, Ind	50	Vacuum Carbonate/Claus.
National Steel Co	Weirton, W. Va	60	Do.
United States Steel Corp	Clairton, Pa	40	Do.
Plants under construction:			
Bethlehem Steel Corp	Bethlehem, Pa	100	Sulfiban/Claus.
Shenango Inc	Pittsburgh, Pa	32	Do.
Commitments for construction:			
Armco Steel Corp	Middletown, Ohio	96	Firma Carl Still/Sulfuric Acid.
Jones & Laughlin Steel Corp.	Pittsburgh, Pa	80	Sulfiban/Claus.
Inland Steel Co	Indian Harbor, Ind	50	Vacuum Carbonate/Claus.
Wheeling-Pittsburg Steel Corp.	Follansbee, W. Va	95	Firma Carl Still/Sulfuric Acid.

Hamilton and Rice described the commercial development of the United States Steel Corp.'s Phosam process for the recovery of coke-oven byproduct ammonia in the form of high-purity anhydrous liquid ammonia.[5]

COAL TAR AND DERIVATIVES

All oven-coke plants produced crude tar in quantities ranging between 5.87 and 9.72 gallons per ton of coal carbonized. Coke plants in California, Colorado, Utah, and West Virginia had the larger yields of tar because these plants used larger percentages of high-volatile coals.

Because 7.1% less coal was carbonized in oven-coke plants, tar production was 4.7% less than in 1975, despite a 2.8% increase in average tar yield.

Coke-plant operators consumed 55.0% of the crude tar produced. Of this quantity, 51.6% was processed (refined or topped) and 40.0% was burned as fuel without any processing. The remaining production, together with withdrawals from stock, was sold to tar-distilling plants for refining into a variety of tar-derived products.

Most of the crude tar that was processed in 1975 was subjected to topping, whereby distillate fractions, consisting mainly of low-boiling tar acids and bases, and naphthalene were obtained. The resulting residue (called soft pitch) was usually used for fuel. Furnace coke plants that were integrated with steel plants in particular benefited from this situation because they could sell the distillate and retain the soft pitch for use as fuel. However, the relative quantities of tar topped, burned, or sold depend on the availability and current market prices of crude tar, tar distillates, and other substitute fuels. Most of the merchant plant tar production was sold because merchant plants had little demand for pitch, which normally represented 65 to 92 volume-percent of the crude tar feed to the topping stills.

Most of the plants that processed crude tar recovered only crude chemical oil (also known as carbolic oil) and liquid still residues ranging up to soft pitch. Some of the larger plants recovered a number of tar-based products, including creosote oil, cresylic acid, cresols, naphthalene, phenols, xynols, pyridine, picoline, quinoline, and medium and hard pitch. Although statistics on many of these tar derivatives are not disclosed in this report because of individual company confidentiality, the data were transmitted to the U.S. Tariff Commission for publishing with similar data from tar distillers and petroleum refiners, in monthly and annual reports on synthetic organic chemicals.

CRUDE LIGHT OIL AND DERIVATIVES

Crude light oil is a mixture of aromatic hydrocarbons, thiophene, mercaptans, hydrogen sulfide, and carbon disulfide that are absorbed from the coke-oven gas after tar, ammonia, and in some instances naphthalene have been removed. Crude tar has an insignificant content of crude light oil that is seldom recovered at coke plants. Practically all crude light oil produced at coke plants is recovered by absorption in which the gas is contacted with a high-boiling petroleum oil or a coal-tar-based distillate as the gas passes through absorption equipment. Crude light oil is stripped from the absorption oil by direct steam distillation. About 2.5 to 3.0 gallons (20 pounds) of crude light oil are usually recoverable per ton of coal carbonized. Yields vary with the kinds of coal carbonized and with operating conditions. An average of 2.55 gallons per ton of coal carbonized was recovered at 51 plants that extracted light oil in 1975. Yield per ton of coal was about the same in both merchant and furnace plants as in 1974. Eleven plants left the light oil in the gas to increase its calorific value.

Producers sold 50.8% of their crude light oil output. The increase of crude light oil sales in recent years is attributed to the inability of some plants to produce derivatives meeting the rigid specifications of dependable quality and competitively priced aromatic petrochemicals. Such plants sell crude light oil to petroleum-refining companies for processing with petroleum-derived fractions into benzene, toluene, and a number of other chemical intermediates.

As with other coal-chemical materials, yields of products derived from crude light oil vary, but about 86.5 volume-percent of the crude light oil processed was recovered in 1975 as salable products, comprising 61.0% as benzene, 11.7% as toluene, 2.1% as xylene, and 2.5% as solvent naphtha. About all of the benzene production was classed as specification grades. In past years, a large amount of motor-grade benzene was used to increase anti-knock properties of gasoline, but current petroleum-refining practices have all but eliminated this use for benzene.

The unit value of light oil derivatives sold in 1975 ranged from $0.749 per gallon for all grades of benzene to $0.355 per gallon average for all crude and refined solvent naphtha. The average value of all light oil products sold decreased 1.0% to $0.698 per gallon, compared with $0.705 per gallon in 1974.

WORLD REVIEW

World production of metallurgical coke in 1975 was estimated at 398.2 million short tons. This quantity was 1.7% less than the 1974 output, and the decrease was attributed to decreased production in West Germany, Italy, the U.S.S.R., the United States, and Japan.

Europe, with 56.2% of the total, led in world production, although European output was 0.6% less than in 1974. Asia, with eight producing countries, ranked second in output with 24.0%. North America, with only three producing countries, ranked third with 16.2%

Australia.—The Australian budget for fiscal year 1976, released on August 19, 1975, included a new export duty on coal of $7.20 per short ton. A further $13 million was demanded by the Queensland Government as additional royalties for exports from mid-August to October 31, the end of the Queensland fiscal year.

Utah Development Co., a 89% owned subsidiary of Utah International Inc., owned and operated four coking-coal mines in Queensland, Australia, with shipments primarily to Japanese and European customers. The subsidiary in mid-August 1975 boosted its prices retroactively for coking-coal deliveries to Japanese plants by $13.50 per short ton retroactive to April 1 and about $15.00 after July 1, 1975. Preliminary discussions were also held with European buyers with the intent of similarly raising prices there.

The Australian firm Oakbridge and Japan's Sumitomo Group agreed to develop Oakbridge's Clarence holdings near Lithgow, New South Wales, to a production level of 3.3 million short tons of coal annually by early 1980. A large portion of the production was to be processed into formed coal by Sumitomo. Oakbridge and Sumitomo have cooperated since 1971 to develop a process for formed coal—a "synthetic" coking coal made from a mixture of coals. Production at a 1.1 million short-ton level was scheduled to begin in 1978.

The Wilputte Corp. received a $32 million contract to engineer and manage the construction of a 36-oven battery at the Whyalla plant, South Australia, of Broken Hill Pty. Co., Ltd. The new battery of 5-meter-high ovens was designed to produce 365,000 tons of blast furnace coke annually from 540,000 tons of coal.

Brazil.—The Midrex Corp. and Usinas Siderurgicas de Minas Gerais, S.A. (Usiminas), Belo Horizonte, early in 1975 reached a technical cooperation agreement for the use of coke-oven gas and blast furnace top gas as a substitute for natural gas in a direct-reduction process. The agreement provided for a feasibility study and large-scale production using coke-oven and blast furnace top gases in the production of 1.0 to 1.2 million tons per year of Midrex metallized iron material for use in blast furnaces and Linz-Donawitz converters.

Midrex Corp. in November received a letter of intent from Usiminas for a series of agreements including a construction contract for two 440,000 short-ton-per-year modules using the Midrex direct-reduction process. The two modules are expected to begin operation in 1978 at Ipatinga, using coke-oven gas as a substitute for natural gas.

Island Creek Coal Co., a subsidiary of Occidental Petroleum Corp., in November 1975 agreed to supply Usiminas with 5 million tons of coking coal over the next 5 years. The agreement, valued at $258 million at current prices, involves about 1 million tons per year of high- and low-volatile coking coals from Island Creek's Virginia and West Virginia mines. Prices will be negotiated annually.

Canada.—During 1974, Kaiser Resources Ltd. produced about 5.29 million short tons of clean coking coal from its large Harmer Ridge surface mine and two underground mines located near Sparwood, British Columbia. The bulk of the coking coal was sent to Japan under a long-term agreement. The base price of Kaiser's Japanese contract, f.o.b. Roberts Bank, was increased progressively from $19.66 per short ton in June 1974 to $27.49 in November. By April 1975, the price was increased further to $44.15 per short ton. These higher coal prices and continued successful processing operations enabled the company in January 1975 to announce its first dividend to shareholders.

All of the 1974 clean coking coal production of approximately 2.2 million short tons by Fording Coal Ltd. came from a multiseam surface mining operation located 35 miles north of Sparwood. Nearly all of this production went to Japan under a long-term contract calling for shipments of 3.3 million short tons annually. The base price paid to Fording under the contract, f.o.b. Roberts Bank, was increased from $19.55 per short ton in April 1974 to $29.29 per short ton in September, retroactive to the beginning of 1974. On April 1, 1975, the price was increased to $42.73 on an interim basis.

Coleman Collieries Ltd. shipped approximately 880,000 tons of clean coking coal to Japan in 1974 from three mines in the Crowsnest Pass area of Alberta. In April 1974 Coleman negotiated a price of $26.36 per short ton, f.o.b. Port Moody, for clean coking coal shipped to Japan under contract. In September 1974 the price was raised to $28.15 per short ton. Effective April 1, 1975, Coleman agreed to a price of $41.71 per long ton under a new 3-year agreement calling for shipments of 825,000 short tons in 1975, increasing to an annual rate of 990,000 short tons commencing in April 1976.

Cardinal River Coals Ltd., The Canmore Mines, Ltd., and Gregg River Resources Ltd. either shipped or signed contracts to ship in 1974 and following years coking coal to Japanese steelmakers from mines in Alberta.

The Bureau estimated the exports from the United States of bituminous metallurgical coals in 1974 and 1975, in thousand short tons as follows:[6]

Destination	1974	1975
Canada	7,488	7,622
Latin America	2,761	3,274
Europe:		
EEC	10,915	9,802
Other Europe	2,899	4,180
Asia	27,604	25,742
Total	51,667	50,620

---

[6] U.S. Bureau of Mines. International Coal Trade. V. 45, No. 6, June 1976, p. 5.

During 1974, McIntyre Mines Ltd. produced 1.65 million short tons of clean coking coal from its No. 2 underground mine and its No. 8 and No. 9 open pit mines near Grande Cache, Alberta. In April 1974, McIntyre reached agreement with Japanese customers for delivery of 1.65 million short tons on a 1-year contract with prices based on Eastern U.S. producer prices for coal of equal rank, quality, and coking properties. One-year contracts were also made with Bethlehem Steel Corp. for 330,000 short tons and The Steel Company of Canada, Ltd., for 220,000 short tons on the same pricing arrangement. In October 1974, McIntyre concluded agreements with its Japanese customers for an advance of $16.3 million on coal deliveries to be received before April 1, 1975, and an immediate price advance of $10.00 per short ton to $36.57 f.o.b. Vancouver. In addition, a new 3-year agreement was finalized calling for delivery of 1.65 million short tons per year beginning April 1, 1975. In April 1975 a f.o.b. Vancouver price of $53.25 was set for McIntyre coal shipped to Japan. In 1975, McIntyre planned to ship 220,000 short tons to The Steel Company of Canada, Ltd., in Hamilton, Ontario, and 165,000 short tons to Sydney, Nova Scotia.

In 1977–78, Canada will have over 22,000 short tons per day of coke capacity, equal to about 7.5 million short tons per year.

In 1974, an average of 1.44 tons of coking coal was required to produce a ton of coke in Canada. The amount of actual coke consumed per short ton of hot metal produced in blast furnaces was 1,020 pounds, down 10 pounds from the rate in 1973. About 66% of the coking coal used in Canada in 1974 was imported from the United States. Approximately 8.3 million short tons of coking coal was carbonized to produce 6.0 million tons of coke (including 5.0 million tons of blast furnace coke).

Three steel companies in Ontario operated coke-oven plants in Hamilton and Sault Ste. Marie. All had captive U.S. mines and long-term contracts. In Sydney, Nova Scotia, the Sydney Steel Corp. used a combination of Nova Scotia and U.S. coals to produce coke for its steel mill. The integrated steelmakers accounted for over 90% of the Canadian coke production.

The Algoma Steel Corp., Ltd., of Sault Ste. Marie, Ontario, began operation of its new No. 9 coke battery in late 1975. Rehabilitation of the No. 7 coke battery was planned for 1975. Construction of the new No. 10 coke battery, identical in size to the No. 9, began in 1974.

France.—Blast furnace trials using 5,000-ton lots of formed coke produced by the HBNPC process were carried out by USINOR in France. Thirty-three to 44% of the normal coke was replaced in two small blast furnaces that worked regularly, despite an increase in resistance to blast.[7]

Japan.—The quantity of coking coals imported by Japan during fiscal year 1974 increased 11%, while the cost during the same period increased by a factor of 2.24 times the average cost for fiscal 1973. The main reasons given in the Japanese steel industry were the labor unrest in Australia and the expectation of a long strike by U.S. coal miners. These reasons caused Japanese buyers to purchase any U.S. coals offered regardless of price and shipping cost. The average import cost per short ton of U.S. coking coal in January 1975 was $97.35, compared with $33.40 in January 1974. In January 1974 1.65 million short tons was imported, and a peak monthly quantity of 3.2 million short tons was reached in November 1974. Only the United States was able to significantly increase the quantity exported to Japan. The imports from the United States accounted for 41% of the total 69.2 million short tons of coal imported in 1974.

The Nippon Steel Corp., Tokyo, after 3 years of experimentation, was successful in briquetting noncoking coal and using the 2-inch-square briquets to furnish 6% to 10% of the coal mixtures carbonized in coke ovens. A 3,000-ton-per-day-capacity plant started operation in September 1975 at the Fukuyama Works of NKK (Nippon Kokan); about half of the 450,000 tons of coke produced monthly was based on coke-oven charges containing varying percentages of briquets.

TECHNOLOGY

Summaries of some of the test data reported in the 1974 Annual Report of the British Carbonization Research Association (BCRA) follow:

1. The omission of a high-rank 204-class coal from a wet Durham blend caused a greater deterioration in the M 40 index than that observed with preheated blends. Preheating the standard and inferior blends caused similar changes whereby the M 40 index improved by about nine and the M 10 index improved by about one. Oiling a single preheated coal charge with 1% of hot heavy fuel oil appeared to have effects similar to those observed with the Durham blend in that the charge bulk density appeared to decrease, the increase (by preheating) in the throughput of the dry coal was reduced from about 40% to 25%, and the coke properties appeared to be unchanged. In tests using a commercial coal blend from Teeside and a medium-rank coal from Yorkshire, increases in the bulk density of both wet and preheated charges caused linear reductions in the main size (M 40 and M 10) indices and porosity of the coke, the apparent relative density increased linearly, and the true relative density was unaffected.

2. BCRA studied the value of a loose chargeable matrix of material around commercial coal briquets in a coke oven. Alone, the briquets could not be discharged from a conventional oven by a conventional pusher machine. A variety of coals, coke breeze, pitch, etc., was tested to act as a matrix surrounding the briquets. Although the results of these tests were not encouraging, a blend of 70% briquets and 30% of selected poorly coking coal was carbonized in a 10-ton oven. No difficulties occurred in charging the oven, but discharging was extremely difficult and for this reason the method was considered impractical for commercial application.

3. A study of the carryover of solids from preheated and wet coal during its gravity charging into coke ovens indicated that the total carryover obtained with on-main charging could be as much or even more than 0.5% of the weight of preheated coal charged to the oven. For wet charges the carryover with on-main charging was much smaller. When charging preheated coal, the dry solids washed out from the gas on a separate charging main constituted about 88% of the total dry solids carried over. The amount of tar in the charging-main solids was about 6% by weight of the dry solids.

4. The results of tests on the behavior of coal during carbonization suggested that the retention of phosphorus in cokes prepared from low- and medium-volatile coals was influenced by carbonizing temperature, increasing as the carbonizing temperature was raised from 800° C to 1,200° C.

Phosphorus retention apparently also increased as the rank of coal decreased; 30% to 40% of the phosphorus present in medium- and high-rank coals was retained in the coke, but 60% to 80% was retained in coke produced from a low-rank, high-volatile coal.

5. The determination of nitrogen in coke is of importance in making accurate heat balances and because of the significant release of oxides of nitrogen into the atmosphere when coke is burned in sintering processes. Investigations using cokes of varying reactivity compared their nitrogen contents as determined by a number of methods, including a modified version of the steam-distillation method of Beet and Belcher dating from 1938.

6. Conclusions drawn from approximately 150 tests in a coke-oven-gas-fueled, 350-kilogram oven used to carbonize three coals and three commercial blends of varying properties at wall temperatures ranging from 1,080° to 1,630° C (equivalent to center-of-charge temperatures of 1,050° to 1,600° C) follow: (a) Heat consumption at the maximum wall temperature (1,630° C) was more than four times that required at a wall temperature of 1,080° C, (b) the coke yield appeared to be independent of wall temperature, and (c) the proportion of plus 80-millimeter-size coke decreased from about 60% at 1,080° C to 17% at 1,600° C, while the yield of 20- to 80-millimeter-size increased from 23% of the charge weight at 1,080° C to 58% at 1,600° C. These size relationships were equally applicable to the cokes made from wet and preheated coal.

7. Micum tests to assess the resistance to breakage were made on samples sized as plus 60 millimeters and 20 to 80 milli-

meters. With increasing wall temperature the M 40 indices on the plus 60- and 20- to 80-millimeter sizes decreased, and the size-degradation indices on the plus 60- and 20- to 80-millimeter sizes increased. The M 10 index generally was only slightly affected, but for cokes made from the lower rank coals, it was significantly improved; for some coals minimum M 10 indices (20 to 80 millimeters) were observed at carbonizing rates of 40 to 50 millimeters per hour and a coke discharge temperature of 1,050° C. In this respect preheated coal charges gave approximately the same response to the temperature of carbonization as did wet coal charges.

8. The reheating (at a wall temperature of 1,625° C) of coke made at a wall temperature of 1,080° C had little effect on its physical properties other than a reduction in mean size caused by handling. Such coke, despite this mechanical breakage, remained larger and had a higher M 40 index than coke produced by direct carbonization at 1,625° C.

9. A considerable part of the reduction in the Micum indices that occurred at higher wall temperatures was attributed to the smaller size of the coke produced at higher wall temperatures as a reasonable consequence of greater thermal stresses that caused increasing fissuring. The tensile strength of the smaller sized coke free of major fissures was greater at a wall temperature of 1,500° C than at 1,080° C.

10. Extra-high-temperature carbonization produced additional removal of sulfur, most probably by decomposition of ferrous sulfide derived from pyrites in the coal carbonized. About 10% more sulfur was removed at 1,625° C than at 1,080° C. Reheating of coke to a center-of-charge temperature of about 1,600° C resulted in a generally similar reduction of the sulfur content. With increasing temperatures of carbonization and of free space, methane and ethylene decomposed mainly to hydrogen and carbon with a corresponding decrease in calorific value of the coke-oven gas mixture. As wall temperature increased, the toluene-insoluble content and density of the tar increased, and the percentage distilling up to 350° C and the phenol content both decreased.

11. The results of the extra-high-temperature carbonization in the 350-kilogram test oven, fabricated using mullite refractories, suggested an increased oven throughput (from 40 to 120 kilograms per hour per cubic meter of charge volume), a coke yield in the preferred size range (from one-quarter to two-thirds sized 20 to 80 millimeters); and a 10% decrease in the sulfur content of the coke. Possible disadvantages to the application of extra-high-temperature carbonization to commercial practice include the high energy requirement resulting from high heat losses, the difficulty of maintaining efficient temperature control and good temperature distribution throughout the oven, the attack on the refractory material resulting from ash fusion, the difficulties and hazards in large-scale operation, and an increase in carbon buildup and in carryover of solids. It was considered that because the disadvantages outweighed the gains, any practical application of extra-high-temperature carbonization seemed remote. This conclusion was reinforced by the fact that most of the advantages can be achieved by carbonizing preheated coal at a wall temperature in the 1,250° C to 1,300° C range.[8]

A Koppers Co. Inc. invention protected by British Patent 1,386,681 reduced the excessive cooling of the regenerator sections under the end flues of coke ovens due to radiant heat loss and ingress of cold air. This was achieved by use of an array of ports having a Venturi or cylindrical shape with flared ends; the top and bottom diameters of these ports were varied along the regenerator so that a uniform upflow distribution of air or lean gas was obtained.

Didier Engineering GmbH and Bergiverksverbland GmbH of West Germany received British Patent 1,387,900 for the programed heating of individual ovens in a coke-oven heating system. Each heating wall is made up of groups of flues, each group consisting of three or four flues side by side in a direction parallel to the long axis of the battery. All the flues adjoining the oven walls are on ascending flow; that is, combustion in them is continuous. The intermediate flue or flues carry away the hot waste gas. Below each group of flues is a metallic recuperator in which heat is transferred from the waste gas to the air or lean gas. The air and lean gas emerge into heating flues at a number of levels to allow the vertical distribution of heat to be regulated.

[8] British Carbonization Research Association. Annual Report. 1974, 60 pp.

The principles of the Lurgi-Ruhrgas process for the carbonization of coal using fine coke as a heat carrier were described. Its use for high-temperature carbonization to produce coke breeze and gas and for low-temperature carbonization to produce semicoke, tar and oil was discussed. Experience with a large-scale test plant at Dorsten, coupled with a steam-raising plant, was summarized, and commercial applications were considered.[9]

The effects of coking rate and final temperature of carbonization in conventional ovens were described.[10] When a single blend of coal was carbonized at three coking rates (30 to 33 millimeters per hour) to a constant final temperature, the mean size and the shatter resistance of the coke decreased but the strength of the coke substance improved as the coking rate was increased. When two blends (one with an increased content of high-volatile coal) were carbonized in commercial ovens at two different flue temperatures and two different final temperatures, an increase in coking rate reduced the mean size of the coke, but the final temperature had little effect. Similarly the shatter resistance was reduced by an increase in coking rate but improved by increases in both variables. An increase in final temperature raised the true density of the coke and reduced its electrical resistivity and reactivity. It was also shown that the effect of an increase in the proportion of weakly coking coal could be offset by raising the coking rate and final temperature.

Reeve and Paulencu indicated that pulverized coke fines can be used to reduce requirements for low-volatile coal in blends used to make coke having acceptable strength for blast furnace use. The coke quality is influenced by the quantity and size of the coke fines added and by the coke-oven operating conditions.[11]

In a paper from National Smokeless Fuels Ltd. (NSF) reviewing the consumption of foundry coke in particular by the iron-castings industry in Britain, specifications agreed for foundry coke produced at five NSF coking plants are quoted. They include a maximum sulfur content of 0.85% to 1.00%, a minimum 2-inch shatter index of 90, and a minimum mean size of 4.0 to 4.2 inch. The costs of cast iron production are discussed with particular reference to the requirements of clean air legislation.[12]

Fundamental data on the operation of biological treatment systems for coke plant waste water were discussed.[13]

The basic features of the Bergbu-Forschung formed-coke process were described, and the results of blast furnace trials using the product were summarized. It was possible to use weakly caking coals as the binder component of the briquetting mix if pitch, or the heavy tar from the char-production stage, or petroleum residue was added to the mix. Details were given for 300-ton-per-day and 650-ton-per-day pilot plants. The dependence of capital and operating costs on the volatile matter of the coals used was clarified.[14]

Accounts of the following formed-coke processes were summarized.[15] The processes, as known by their owners or developing institutions, are FMC, BFL, Ancit, HP-NPC, Republic Carbon Products Co., Department of Energy, Mines & Resources of Canada, U.S. Bureau of Mines, Auscoke, University of Ife (Nigeria), and the National Research Institute for Pollution and Resources (Japan). Items discussed randomly in relation to the 10 processes included: Equipment, coal and other materials used in blends, carbonization conditions, operating difficulties, yields, chemical and physical analyses, flowsheets, and economics.

The chemical, physical, and mechanical characteristics of cokes were studied to obtain guidance in formulating the blend composition and coal-preparation conditions for the production of metallurgical coke. The effects on tensile strength and reactivity of coke were discussed.[16]

The mechanism and identification of the

principal factors influencing the formation of pores in semicoke and coke were evaluated.[17]

A new process for recycling and upgrading 450 tons per day of minus 3/16-inch coke fines at the Clairton coke works of the United States Steel Corp. was described.[18]

A reliable method for evaluating coking coal before it enters the steel plant complex was thoroughly described and evaluated by Thompson and Benedict, who relate the petrographic composition of coal to coking behavior and coke quality.[19]

During 1973 and 1974, Salem Corp.'s partnership, Coaltek Associates, licensed nine Coaltek systems for preheating coal and charging it by pipeline direct to coke ovens. Four of these installations are located in the United States and five overseas. In 1975, five were operating; the balance were expected to go on line in 1976. As anticipated on any new process, certain difficulties were experienced in startups; however, the Coaltek system is providing the advantages claimed by its developers—improving coke quality, utilizing less costly and more readily available grades of coal, substantially increasing coke production, and minimizing air pollution.

Proposed standards for coke-oven emissions as established by the Labor Department's Occupational Safety and Health Administration (OSHA).[20] A study made for OSHA estimates that the cost of compliance for the coke industry will be $495 million in added capital expenditures ($7.45 per ton of coke) and about $295 million for annual operating costs ($4.45 per ton of coke).

On August 4, the president of the United Steelworkers of America (USWA) stated that OSHA's standards did not contain sufficient provisions for enforcement and sidestepped recommendations made the Labor Department's own advisory committee. On August 6, the president of the American Iron and Steel Institute (AISI) classed as inaccurate the USWA statement that the Labor Department favored industry by largely ignoring standards recommended by a committee composed of people from industry, labor, and the public. The AISI spokesman also said the proposed standards for particulate emissions appeared to be unattainable even with the implementation of the suggested engineering controls because the different batteries in the United States have ovens ranging from 10 to 20 feet high, with capacities of 12 to 36 tons of coal, and ages ranging up to 45 years. Only about one-third of the oven batteries have double collecting mains, and the majority of the batteries have luted rather than self-sealing doors.

OSHA said that because it did not know what "agent" was causing the health problem, usually related to lung cancer development, Federal standards should be based on the emission of an indicator substance. The proposed Federal standards would use benzo-a-pyrene (BAP) as an indicator of coke-oven emissions. Despite this situation OSHA said it will retain its proposal to limit worker exposure in a 40-hour workweek to no more than an 8-hour time-weighted average of 0.3 milligram of respirable particles per cubic meter of air.

On November 4, 1975, steel industry representatives and union officials, in a surprise move, said they would try privately to form a joint management-labor proposal on coke-oven emission standards. Prior to the announcement, industry officials claimed that the cost of the OSHA standards was too harsh on industry, while the USWA officials called the proposed standards a giveaway to industry.

In December 9 public hearings, the chairman of the AISI's Coke Committee told OSHA rulemakers that general uniform standards that may be practical at one coke plant might not work at another. The chairman listed major differences in configurations of coke batteries in the United States. The differences must be considered in implementing specified engineering controls and administrative procedures for a given battery.

The Jones & Laughlin Steel Corp. and the Environmental Protection Agency (EPA) agreed on an environmental consent order that gave new life to the corporation's aging Pittsburgh works and could become the blueprint for controlling coke plant pollution throughout the steel industry. The agreement noted the firm's doubts about its ability to meet air pollution laws, despite its substantial good-faith effort to comply, while preserving its legal right to challenge the regulations that cannot be met by current technology.

Duncan described the actions taken in Ontario to establish air emission regulations and guidelines as governed by the Federal and Provincial legislation concepts which, although very different, do produce consistent results.[21]

Specifications describing coke-side pollution control equipment were described in three patents. In one Simon-Carves design, covered in British Patent 1,373,164, the end walls and outer side wall of the coke car are built-up to the height of the coke guide so that the coke car is entirely enclosed during pushing. A second Simon-Carves development, protected by British Patent 1,368,104, uses a smoketight hood supported by the guide machine to cover the coke car and the coke guide. Both Simon-Carves systems use trunking conduits provided with water troughs. In a third arrangement, covered under British Patent 1,372,573 and assigned to Harting, Kuhn & Co. Maschinefabrik Gmbh, air pollution is prevented by a hood that abuts the coke guide, extends over the coke car, and has associated ducts connected to venturi scrubbers for eliminating the fumes. The hood and scrubbers are mounted on a carriage supported by a framework parallel to the coke-car track. British Patent 1,372,636, assigned to the Wilputte Corp., covers a coke-oven door-frame cleaning mechanism that has sets of spring-loaded scraper blades that can be reciprocated along guided paths by hydraulic rams.

Equipment and practices to control air emissions were summarized by Voelker.[22] Topics covered included oven charging, coke quenching, other intermittent emissions, continuous emissions, and personal environment.

The Granite City Steel Div. of National Steel Corp. successfully tested a pilot model and applied for a patent on a "one-spot coke receiver system." The system reportedly fully encloses the coke push and captures its emissions by an enclosed container car that remains stationary during the push. The design of the coke receiver car causes the incandescent coke to flow in two directions, filling the entire car. A 50,000-cubic-foot-per-minute fan on a trailer car draws emissions from the coke-pushing operation into a high-energy venturi scrubber. It is claimed that the new control system will not increase the exposure of the coke-oven worker to smoke as has happened when using coke-side sheds.

The Salem Corp. of Pittsburgh, Pa., obtained British Patent 1,375,345 relating to a continuous coke quencher, consisting of two contiguous hoppers, mounted on a carriage with associated fume-extraction equipment and a rotary table beneath each hopper on which the coke is quenched by water sprays.

The first trials of a wet electrostatic precipitator on a coke-side enclosure at a St. Louis, Mo., coking plant were described. The trials indicated that the precipitator was more efficient than low- or high-energy scrubbers operated in parallel, removing more than 98.5% of the bimodal mixture of 3- to 30-micrometer carbon particles and submicrometer hydrocarbon droplets. Wet precipitators for coke-side enclosure were ordered by two North American coke producers.[23]

The Gewerkschaft Schalker Eisenhutte obtained British Patent 1,377,894 for a burner that assures the stable combustion in a washer-type car of the gases extracted from a coke oven during charging. The combustion chamber surrounding the burner head contains an electric igniter, ports for admitting secondary air, and a spoiler ring. The combination produces a toroidal vortex downstream from the burner head and stabilizes the flame despite variations in the draft produced by the suction fan.

The U.S.S. Engineers and Consultants Inc. obtained British Patent 1,382,085 covering a modification of the Wolff self-sealing system for coke-oven doors. Some hook bolts are replaced by bolts with disks welded to their outer ends. The disks on each bolt carry a pin extending into a slotted wedge plate, the slanting edge of which bears against the bolt. Rotation of the bolt pushes the sealing strip into contact with the door frame. The bolt is clamped in position by a locknut.

[23] Bakke, E. J. Air Pollution Control Assoc., v. 25, No. 2, 1975, pp. 163–167.

New designs of pipeline-charged high-battery ovens, first placed in operation by Inland Steel Co. on August 13, 1974, and by Jones & Laughlin Steel Corp. on December 25, 1975, have complicated the refractory specifications. In the 200-foot-high preheat coal chambers, where abrasion and moisture abound, a high-alumina castable was being tried in 1975. Although their output coal temperatures are only 450° to 550° F, preheat chambers are the heart of the charging system.

IHI Heavy Industries Co., Ltd., received an order from Kawetetsu Chemical Industry Co., Ltd., of Japan for a new dry-quenching plant including three blocks of tower boilers and a coke-handling system. Each block consists of a cooling tower with a coke capacity of 61.6 short tons per hour, a heat recovery boiler (steam capacity of 33 short tons per hour at 18 kilograms per square centimeter gage and 229° C), and an inert gas circulating system. The dry quenching system cools the coke from about 1,000° C to below 250° C while effectively recovering sensible heat by using circulating inert gas instead of water sprays. IHI licensed the dry-quench technology in 1974 from the U.S.S.R.

Tall-coke-oven design requires the use of high-density silica brick, containing 95% to 96% SiO_2 and weighing 114 to 120 pounds per cubic foot. Experimental brick weighing 122 pounds per cubic foot were in use. Their thermal conductivity was as much as 14.5 Btu per hour, per square foot, per degree F, per inch, at 1,500° F.

Two classes of silica brick produced in large quantities for use in coke oven construction and repair are a superduty brick with total alumina, titania, and alkalies held to 0.2% to 0.5%; and conventional silica brick containing between 0.5% and 1.2% total alumina, titania, and alkalies. The rest of the chemical content of such brick for coke ovens specifies 94% to 95% SiO_2 and approximately 3% maximum CaO and MgO as bonding agents. Normal tests applied to silica brick include density, specific gravity, porosity, high-temperature strength, and cold-crushing strength. Silica brick exhibit trivial expansion or contraction over the 1,200° to 2,700° F operating range of a coke battery. Superduty silica brick have shape stability within a few degrees of melting because they do not have a softening range like fireclay brick.

Table 2.—Statistical summary of the coke industry in the United States in 1975

	Slot ovens	Beehive ovens	Total
Coke produced:			
At merchant plants ---------- thousand short tons --	4,716	(1)	(1)
At furnace plants [2] ---------- do ----	51,778	(1)	(1)
Total [3] ---------- do ----	56,494	718	57,207
Breeze produced ---------- do ----	4,281	--	4,281

[1] Calculated by dividing production by coal carbonized at plants actually recovering breeze.
[2] Included with "Undistributed" to avoid disclosing individual company confidential data.
[3] Included with Indiana to avoid disclosing individual company confidential data.
[4] Included with Michigan to avoid disclosing individual company confidential data.
[5] Data may not add to totals shown because of independent rounding.

NOTE.—No recovery from beehive coke production was recorded in 1974–75.

Table 10.—Oven- and beehive-coke breeze used and sold in the United States, by use

(Thousand short tons)

Year	Used by producers: In steam plants	Used by producers: In agglomerating plants	Used by producers: For other industrial use	Sold	Average value per ton
1971	309	1,582	650	1,879	$10.80
1972	265	1,305	704	[1]2,113	10.59
1973	234	1,689	917	[1]2,165	10.39
1974	204	1,470	971	2,310	17.83
1975	257	1,202	715	1,953	32.21

[1] Does not include beehive-coke breeze sold (to avoid disclosing individual company confidential data).

Table 11.—Apparent consumption of coke in the United States

(Thousand short tons)

Year	Total production	Imports	Exports	Net change in stocks	Apparent consumption [1]	Consumption: In iron furnaces [2]: Quantity	Consumption: In iron furnaces [2]: Percent	Consumption: All other purposes: Quantity	Consumption: All other purposes: Percent

Grand total	r 422,770	424,907	417,487

e Estimate. p Preliminary. r Revised.

[1] In addition to the countries listed, Algeria, Australia, Malaysia, the People's Republic of China, Mexico, Norway, Romania and the U.S.S.R. have produced gashouse coke in previous years and may have continued production during the time period covered by this table. However, no official statistics are available, and information is inadequate to make reliable estimates of production levels. Except where otherwise noted, coke breeze has been excluded from this table.

[2] Coke production at high temperature in conventional carbonizing equipment (including slot and beehive coke ovens).

[3] Includes breeze.

[4] Includes relatively small amounts of gas coke.

[5] May include some gas coke.

[6] Includes relatively small amounts of low-temperature coke.

[7] Data are total of so-called hard coke production from collieries and coke plants (including those at steelworks).

[8] Includes coke produced at high temperatures in carbonizing equipment designed primarily for gas manufacture (horizontal and vertical coal-gas retorts). In addition to the countries listed, Canada and Finland produce gas coke. However, this figure is not reported separately and has been included with metallurgical coke.

[9] Less than ½ unit.

[10] Includes coke produced at low and medium temperatures, as well as that produced in unconventional equipment (chain-grate cokers). In addition to the countries listed, the U.S.S.R. may produce coke from brown coal, but output is not officially reported and no basis is available for reliably estimating output levels.

[11] Includes coke produced from lignite at high temperature.

Table 22.—Quantity, sulfur content, and value at ovens of coal carbonized in the United States in 1975, by State

Grand total[6]	XX	XX	560,927	XX	XX

XX Not applicable.

[1] Includes products of tar distillation conducted by oven-coke operators under the same corporate names.

[2] Soft—water-softening point less than 100° to 160° F; hard—oven 160° F. Figures on soft pitch include hard pitch to avoid disclosing individual company confidential data.

[3] Creosote oil, cresols, cresylic acid, naphthalene, phenol, refined tar, tar paint.

[4] Included with sulfate to avoid disclosing individual company confidential data.

[5] Includes gas used for heating ovens and gas wasted.

[6] Data may not add to totals shown because of independent rounding.

[7] Includes 95,178,000 gallons refined by coke-oven operators to make derived products shown.

[8] Included with "Specification grades" to avoid disclosing individual company confidential data.

Table 34.—Coal equivalent of the thermal materials, except coke, produced at oven-coke plants in the United States

Year	Materials produced				Estimated equivalent in heating value [1] (billion Btu)					Coal [2] equivalent (thousand short tons)
	Coke breeze (thousand short tons)	Surplus gas (billion cubic feet)	Tar (thousand gallons)	Light oil (thousand gallons)	Coke breeze	Surplus gas	Tar	Light oil	Total	
1971	4,048	507	679,377	201,626	80,960	278,850	101,907	26,211	487,928	18,623
1972	4,261	534	747,186	214,201	85,220	293,700	112,078	27,846	518,844	19,803
1973	4,902	596	732,455	226,110	98,040	327,800	109,868	29,394	565,102	21,569
1974	5,094	574	677,447	217,416	101,880	315,700	101,617	28,264	547,461	20,896
1975	4,281	527	645,537	194,814	85,620	289,850	96,831	25,326	497,627	18,993

[1] Breeze, 10,000 Btu per pound; gas 550 Btu per cubic foot; tar, 150,000 Btu per gallon; light oil, 130,000 Btu per gallon.

[2] At 26,200,000 Btu per short ton of coal.

Table 35.—Average value of coal-chemical materials used or sold and of coke and breeze per short ton of coal carbonized in the United States

	1971	1972	1973	1974	1975
Ammonia products	$0.136	$0.141	$0.177	$0.418	$0.397
Light oil and its derivatives	.365	.350	.418	1.276	1.233
Surplus gas used or sold	1.640	1.660	2.052	3.366	3.549
Tar and its derivatives (including naphthalene):					
Tar burned by producers [1]	.341	.366	.572	.753	.945
Sold	.721	.720	.611	1.528	1.616
Total	3.203	3.237	3.830	[2] 7.342	7.740
Coke produced [3]	21.135	22.978	26.315	50.005	57.843
Breeze produced	.534	.533	.558	1.022	1.414
Grand total	24.872	26.748	30.703	58.369	66.997

[1] Includes pitch-of-tar.

[2] Data do not add to total shown because of independent rounding.

[3] Average value of coke used or sold.

Table 36.—Percentage of coal costs recovered from the recovery of coal-chemical materials in the United States

	1971	1972	1973	1974	1975
Product:					
Ammonia products	1.1	1.0	1.0	1.2	1.0

Columbium and Tantalum

By Henry E. Stipp [1]

Consumption of columbium in the form of ferrocolumbium, ferrotantalum-columbium, and other columbium and tantalum materials decreased 28% in 1975 to 3.3 million pounds of contained columbium and tantalum, compared with consumption of about 4.6 million pounds in 1974. Consumer stocks of ferrocolumbium, ferrotantalum-columbium, and other columbium and tantalum materials, which were built-up to new high quantities in 1974, were reduced 35% to 1.1 million pounds (contained Cb and Ta), compared with 1.7 million pounds in 1974. The decreased consumption of columbium in steels and superalloys was the result of a downturn in the economy which affected automobile manufacture, building construction, and transportation. Oil and gas pipelines and offshore drilling platform construction was affected less than other sectors of the economy and accounted for a large part of the consumption of columbium in specialty steels.

Columbium consumption in raw materials decreased 34% in 1975 to about 2.1 million pounds (Cb content), compared with 3.2 million pounds in 1974.

Consumption of tantalum in raw materials decreased 56% in 1975 to about 1.1 million pounds (contained Ta), compared with 2.4 million pounds in 1974. Reduction of large inventories of tantalum by producers of electronic capacitors reportedly was mainly responsible for decreased sales of tantalum by domestic processors.

Imports of columbium mineral concentrates decreased 51% to 1.5 million pounds (gross weight), compared with 3.1 million pounds in 1974. Columbium concentrates came mainly from Brazil, 74%; Nigeria, 10%; and Malaysia, 9%. Ferrocolumbium imports from Brazil decreased 43% to about 1.9 million pounds (contained Cb), compared with 3.3 million pounds in 1974. Tantalum mineral concentrates imports were down 14% to about 1.6 million pounds (gross weight), compared with around 1.9 million pounds in 1974. Imports of tantalum concentrates came chiefly from Canada, 41%; Australia, 13%; and Brazil, 9%.

Legislation and Government Programs.—Sales of columbium and tantalum from U.S. Government stockpile excesses in 1975 amounted to 56,959 pounds (Cb content) of columbium concentrate and 64,653 pounds (Ta content) of tantalum concentrate. Shipments of columbium materials from U.S. Government stockpile excesses totaled 463,000 pounds (Cb content), and shipments of tantalum materials totaled 87,000 pounds (Ta content) for the same period. At yearend the General Services Administration (GSA) had sold all of the columbium and tantalum from stockpile excesses authorized by Congress; no further sales were expected to take place in the immediate future.

[1] Includes 149,590 pounds of nonstockpile-grade material.

DOMESTIC PRODUCTION

There was no domestic mine production of columbium and tantalum reported in 1975.

Data on production of columbium metal powder and ingot are withheld to avoid disclosing proprietary company information. Generation of columbium metal scrap was 50,646 pounds, Cb content, compared with 126,240 pounds in 1974. Tantalum metal powder production (including capacitor-grade powder) decreased 54% to 844,389 pounds (contained Ta), compared with 1,849,177 pounds in 1974. Tantalum metal ingot production was 367,394 pounds (Ta content), a decrease of 48% from the 712,121 pounds in 1974. Scrap tantalum metal generation totaled 259,120 pounds (Ta content), compared with 406,056 pounds in 1974. Ferrocolumbium was produced by four domestic firms in 1975. Output decreased 49% to 985,000 pounds (Cb content), compared with 1,917,000 pounds in 1974.

A major titanium ore deposit that contains significant quantities of columbium was discovered.[2] Located in southwestern Colorado, the deposit reportedly contained 419 million tons of mainly perovskite ore (a calcium titanium oxide that contains columbium) based on a cutoff grade of 9% titanium dioxide (TiO_2) content.

CONSUMPTION AND USES

High-purity columbium metal consumption totaled 130,130 pounds, a decrease of 41% from the 220,696 pounds consumed in 1974. The principal end use for high-purity columbium metal, in powder and ingot form, was in high-temperature superalloys required mainly by the aerospace industry.

Tantalum metal consumption, decreased 61% to 450,250 pounds, compared with 1,159,201 pounds in 1974. The principal end uses for tantalum metal was in capacitors and other electronic equipment, and in corrosion-resistant chemical equipment. Consumption of capacitor-grade powder decreased 99% from that of 1974; consumption of tantalum in the manufacture of chemical equipment decreased about 54% from that of 1974. Tantalum carbide consumption in cutting tool applications decreased 22% from that of 1974.

Columbium and tantalum in the form of ferroalloys were added to steels to control the formation of carbon and nitrogen compounds, to improve yield strength and weldability, and to increase low-temperature strength and toughness. Consumption of ferrocolumbium, ferrotantalum-columbium, and other columbium and tantalum materials in steelmaking decreased 19% to 2,744,299 pounds of contained columbium and tantalum, compared with 3,388,601 pounds in 1974. Columbium and tantalum, consumed in the form of ferroalloys in 1975, by major end use categories, was as follows: High-strength, low-alloy steel, 31%; carbon steel, 24%; stainless and heat-resisting steel, 14%; superalloys, 13%; full alloy steel, 12%; and alloys (excluding alloy steels and superalloys), 2%. Ferrotantalum-columbium consumption was negligible accounting for 1% of total columbium and tantalum ferroalloys consumption. The major end use for ferrotantalum-columbium was in stainless and heat-resisting steel.

The use of columbium in high-strength, low-alloy steel was 16% less than in 1974; however, consumption in this category was expected to increase because of greater use in automobiles, oil and gas pipelines, offshore-drilling platforms, ship plate steel, and heavy machinery steel. Applications for high-strength, low-alloy steel in automobiles included bumpers and bumper reinforcements, engine mounts, bumper energy absorbers, wheel spiders, door intrusion beams, and tie rod sleeves. Research and development on a number of columbium metal alloys as superconductors of electricity at cryogenic temperatures was reported.

Table 5.—Reported shipments of columbium and tantalum materials

STOCKS

Processor and dealer inventories of columbium and tantalum materials at yearend were as follows, in pounds, contained columbium and tantalum:

Material	Dec. 31, 1974	Dec. 31, 1975
COLUMBIUM		
Primary metal	[r] 86,590	54,560
Ingot	86,548	33,344
Scrap	112,817	55,453
Oxide	536,588	949,333
Other compounds	[r] 12,741	16,226
TANTALUM		
Primary metal	218,855	232,008
Capacitor-grade powder	[r] 108,226	97,457
Ingot	82,620	84,527
Scrap	[r] 278,203	312,960
Oxide	69,580	74,962
Potassium tantalum fluoride	138,678	98,501
Other compounds	56,674	48,474

[r] Revised.

Columbium and tantalum stocks of raw materials, reported by processors and dealers at yearend 1975, in thousand pounds, contained Cb or Ta, (1974 figures in parentheses), were as follows: Columbite, Cb-552, Ta-69, (Cb-1,303, Ta-159); tantalite, Ta-976, Cb-545, (Ta-568, Cb-507); tin slag, Ta-2,667, Cb-2,092, (Ta-2,645, Cb-2,034); and pyrochlore, Cb-28, Ta—, (Cb-169, Ta—).

Stocks of ferrocolumbium, ferrotantalum-columbium, and other columbium and tantalum materials held by consumers as of December 31, 1975 were as follows (stocks on December 31, 1974 in parentheses): Ferrocolumbium, 1,091,372 (1,719,425) pounds of contained columbium; ferrotantalum-columbium, 10,500 (10,837) pounds of contained columbium and tantalum; and other columbium and tantalum materials, 30,744 (46,947) pounds of contained columbium and tantalum. Producer stocks of ferrocolumbium at yearend 1975 were 1,077,500 (1,145,100) pounds of contained columbium.

PRICES

Contract rates for Canadian pyrochlore, f.o.b. mine and mill, which decreased to $1.56 per pound of contained columbium oxide (Cb_2O_5) on September 9, 1974, remained at that level throughout 1975. Prices for Brazilian pyrochlore were quoted as nominal throughout 1975. For material having a Cb_2O_5 to Ta_2O_5 ratio of 10 to 1, spot columbite ore, c.i.f. U.S. ports was $1.60 to $1.70 per pound, at the beginning of the year, and advanced to $1.80 to $1.90 per pound of contained pentoxides on January 9, 1975. It remained at that price throughout 1975.

Spot prices for low-alloy grades (15:1 ratio) of ferrocolumbium per pound of contained columbium (Cb), ton lots, f.o.b. shipping point, were $4.00 to $4.12 per pound on January 9, 1975, increased to $4.30 per pound of contained columbium on October 27, 1975, and remained at that level for the balance of the year. Prices for high-purity grades, same basis, were $8.61 to $8.65 per pound of contained Cb throughout 1975.

U.S. reactor-grade columbium ingot was quoted at $18 to $25 per pound of columbium throughout 1975. U.S. reactor-grade columbium powder was quoted at $30 to $45 per pound throughout 1975.

Spot tantalite ore was quoted at $13.75 to $16 per pound of tantalum oxide (Ta_2O_5), 60% basis, c.i.f. U.S. ports, on December 13, 1974; decreased to $13.75 to $14.50 per pound of contained tantalum oxide on February 7, 1975, and on December 30, 1975 increased to $15.50 to $16.50 per pound of Ta_2O_5 content. Tantalum Mining Corporation of Canada Ltd. (TANCO) tantalite was quoted at $15 per pound of contained Ta_2O_5 throughout 1975.

U.S.-grade tantalum powder was quoted at $35.40 to $44.50 per pound of tantalum (Ta) throughout the year. U.S. rod was $45 to $54 per pound of tantalum, and advanced to $52 to $80 per pound of Ta on October 1, 1975. U.S. sheet tantalum was $50 to $57 per pound of Ta until October 1, 1975, when it advanced to $48 to $118 per pound of Ta and stayed at that level for the balance of 1975.

Thailand tin slag from the Thailand Smelting and Refining Co. Ltd. (Thaisarco) smelter, containing about 12% Ta_2O_5, was quoted at $5 per pound of contained Ta_2O_5 at the beginning of the year, and was quoted as nominal for the balance of the year.

Table 7.—Average grade of concentrate received by U.S. consumers and dealers in 1975, by country of origin

FOREIGN TRADE

Exports of columbium and columbium alloys, unwrought and waste and scrap, were shipped from the United States mainly to Mexico, 64%; the United Kingdom, 31%; and Japan, 5%. Wrought columbium and columbium alloys went chiefly to Canada, 31%; West Germany, 26%; and the United Kingdom, 24%.

Tantalum ores and concentrates were exported to Belgium, 63%; Japan, 19%; and West Germany, 18%. Wrought tantalum and tantalum alloys, shipped from the United States, went mainly to West Germany, 38%; the United Kingdom, 30%; and France, 10%. Crude tantalum metals and alloys, and scrap were exported chiefly to West Germany, 61%; the United Kingdom, 28%; and Italy, 7%. U.S. exports of tantalum and tantalum-alloy powder were shipped primarily to West Germany, 34%; Japan, 22%; France, 15%; and the United Kingdom, 13%.

Imports for consumption of columbium mineral concentrates decreased 51% in quantity (gross weight) and 37% in value compared with those of 1974. Columbium unwrought and waste and scrap, imported from the Netherlands, 60% and West Germany, 40%, totaled 844 pounds valued at $9,479. Unwrought columbium alloys, all from Canada, were 24 pounds valued at $422. Imports of wrought columbium metal, mainly from Japan, amounted to 2,195 pounds valued at $14,203.

Tantalum mineral concentrates, imported for consumption, decreased 14% in quantity (gross weight), but remained at about the same value as in 1974. Unwrought tantalum and tantalum waste and scrap, imported mainly from West Germany, 36%; Mexico, 28%; and the United Kingdom, 17%, totaled 128,041 pounds valued at $959,844. Unwrought tantalum alloys, chiefly from Canada, amounted to 190 pounds valued at $2,924. Imports of wrought tantalum metal, primarily from West Germany, 50%; the United Kingdom, 32%; and Belgium-Luxembourg, 11%, totaled 1,994 pounds valued at $35,313.

Tin slag imports, mainly from Thailand, 93%; and Brazil, 5%; decreased 71% in gross weight from that of 1974.

Table 8.—U.S. exports of columbium and tantalum, by class
(Thousand pounds, gross weight, and thousand dollars)

WORLD REVIEW

Australia.—A description of the Greenbushes Mineral Field was published.[3] Located on the Southwest Highway 158 miles (254 kilometers) south of Perth, the mineral area covers approximately 35.9 square miles (93 square kilometers). Greenbushes Tin N.L., the largest producer in the area, mines tin and tantalite ore from a pegmatite dike that outcrops for 1.5 miles (2.4 kilometers) parallel to the Southwest Highway. The company treats about 598,000 cubic yards of ore per year, producing a rough concentrate containing around 30% cassiterite and tantalite. This is refined at a dry concentrating plant to a final product containing about 47% Ta_2O_5, 30% Cb_2O_5, 2% TiO_2, and 1.7% Sn. Production in 1975 was 83,333 pounds of tantalum oxide (Ta_2O_5), and it has averaged 113,128 pounds per year from 1971 through 1975. Reserves of cassiterite and tantalite ores were reported at 2.9 million cubic yards.

Brazil.—Companhia Brasileira de Metalurgia e Mineração reportedly exported 10,469 tons (estimated to contain 15 million pounds Cb) of ferrocolumbium to world markets in 1975.

Canada.—St. Lawrence Columbium & Metals Corp. reportedly produced 4.2 million pounds of columbium oxide in concentrate in 1974.[4] Expansion of capacity could increase output in 1975 to about 5.5 million pounds and to about 8 million pounds in 1977.[5] St. Lawrence planned to reactivate its ferroalloy plant in 1976 to produce ferrocolumbium and eventually ferrovanadium and ferrotungsten. Shipments of columbium concentrate by St. Lawrence in 1975 were valued at $6.48 million, compared with shipments valued at $6.68 million in 1974.

Niobec Inc. planned to produce 5.5 million pounds of columbium concentrate grading 60% Cb_2O_5 starting in April 1976.[6] The mine and mill located at St. Honore, Quebec, near Chicoutimi has a capacity of 1,500 tons per day of ore, and is designed so that capacity can be increased 25% to 30% easily. Ore reserves capable of mining by open pit were estimated at 600 million pounds of columbium oxide (Cb_2O_5). Reportedly Niobec Inc. has 5-

year contracts for the sale of 60% of planned production to the United States, European, and Japanese consumers.

A report was published describing the Bernic Lake tantalum deposit of Tantalum Mining Corp. of Canada Ltd.[7] The most abundant tantalum minerals in the deposit were said to be wodginite, tantalite, and microlite. Reserves of tantalum ore, calculated from diamond drill cores after applying a factor for percent of Ta_2O_5 present were reported on January 1, 1976 as 936,613 tons of ore grading 0.150% tantalum oxide (Ta_2O_5). Two economic tantalum bearing zones in the pegmatite are known as the shaft ore body and the west ore body. A 700-foot-long section between the two ore bodies contains lepidolite, minor microline, and aplitic albite, and could contain minable quantities of tantalum in some sections; however, this area has not been included in reserves. The area east of the shaft ore body has potential tantalum ore, but has not been measured. A second pegmatite sill 100 feet below the main pegmatite ore body has yielded tantalum-bearing drill intersections, but it has not been adequately measured and it is not included in reserves.

Malaysia.—The smelting of tin concentrates at Penang, Malaysia and the resulting production of tantalum bearing tin slag was described.[8] From 1930 to around 1950, Malaysia and Thailand tin concentrates were smelted at Penang and the slag used mainly for earthfill. After 1950 Union Carbide Corp. purchased large quantities of tin slags and the earthfill dumps were redug, the slag cleaned and shipped to the United States. In 1967, the Thaisarco smelter at Phuket, Thailand began smelting tin concentrates produced in Thailand. Tin concentrates going to the Malaysian smelters since 1967 are lower in contained tantalum, ranging from 0.05% to 0.50% tantalum content. The tantalum to columbium ratio is about 1 to 1.2. At the present time, two smelters are operating at Penang; Datuk Keramat Smelting, Bhd. and Straits Trading Co. Ltd. Primary slags produced are analyzed and graded by tantalum content into high, medium, and low groups, which are stocked. Resmelted or secondary slag is produced in three grades averaging 3.5% Ta_2O_5, 2.75% Ta_2O_5, and under 2% Ta_2O_5. In 1974, Malaysia produced 2,276 tons of slag averaging 2.80% Ta_2O_5 or 140,500 pounds Ta_2O_5 content. From 1965 through 1974, slag production averaged 3,513 tons containing an average 2.68% Ta_2O_5 content.

Thailand.—The Thai Government completed its takeover of the offshore tin mining concessions of Thai Exploration and Mining Co. (TEMCO).[9] TEMCO was owned by Union Carbide Corp., 46%; Billiton N.V., a Netherlands based firm, 46%; and the Thai Government, 8%. In December Union Carbide Corp. sold its holdings in TEMCO, Thaisarco, and several other firms outside Thailand to Billiton N.V.[10] Thaisarco produces for sale tin slags that contain up to 12% tantalum oxide (Ta_2O_5).

e Estimate. p Preliminary. r Revised.

[1] Excludes columbium and tantalum-bearing tin concentrates and slag.

[2] In addition to the countries listed, Burundi, Spain, South-West Africa, the U.S.S.R. and Zambia also produce or are believed to produce columbium and tantalum mineral concentrates, but available information is inadequate to make reliable estimates of output levels.

[3] Data on gross weight generally has been presented as reported in sources, divided into concentrates of columbite, tantalite, pyrochlore and microlite where information is available to do so, and reported in groups such as columbite-tantalite where it is not.

[4] Unless otherwise specified, content is estimated on the basis of the content reported for the United States imports from the country in question. Estimates specifically marked as estimates are based on estimated gross weights.

[5] Content calculated on the basis of data in source publication recording gross weight.

[6] Less than ½ unit.

[7] Content calculated in terms of metal from data reported in source publication in terms of contained pentoxide.

TECHNOLOGY

The Federal Bureau of Mines released results of research conducted on preparing nitride compounds of columbium, vanadium, and tantalum and on methods of decomposing these compounds to obtain pure metals.[11] Oxides of the metals studied were reacted with ammonia in vertical, gas-solids reactors at 300° C to 1,300° C to produce metal nitrides. Improved results were obtained by using a rotary kiln. Products with less than 1% oxygen were obtained in about 6 hours under optimized conditions. Solid-state purification and arc and electron-beam melting were used to decompose the metal nitrides. Columbium and tantalum of 99.9% purity was prepared by electron-beam melting of the respective metal nitride.

Trace impurities in high-purity columbium were determined by irradiation of a sample with protons and detection of the gamma and X-rays given off with a gallium-lithium and germanium detector.[12] Impurities determined were titanium, vanadium, chromium, iron, zirconium, molybdenum, hafnium, tantalum, and tungsten. Lead, tin, and antimony were not present; however, they could have been determined, if present.

A technical-grade columbium oxide containing 95% Cb_2O_5 was obtained by chlorination of pyrochlore concentrate at 700° C in the presence of carbon, and by absorbing the volatilized columbium oxychloride ($CbOCl_2$) in water.[13] The product was filtered, dried, and calcined. Rare earths and thorium were recovered by leaching the residue with water. A mixture of chlorine and sulfur dioxide reacted with pyrochlore concentrate at 300° C to 700° C also was studied. Results indicated that columbium oxychloride and calcium sulfate were formed.

The hardness of columbium alloyed with zirconium, hafnium, molybdenum, tungsten, rhenium, ruthenium, osmium, rhodium, or iridium was tested.[14] Results suggest that an extrinsic mechanism, such as solute-interstitial interaction was responsible for the softening in tantalum and columbium alloys.

Alloys of columbium with gallium were studied for their crystal structure.[15] Arc-melted, annealed, and powdered specimens containing from 28 to 45 atomic percent gallium were analyzed by metallographic and X-ray diffraction analyses. Three intermediate phases, Cb_3Ga, Cb_5Ga_3, Cb_5Ga_4, and also $Cb_5Ga_3O_x$ were detected.

The corrosion of columbium, tantalum, and vanadium metal in flowing, liquid sodium was studied.[16] It was concluded that group 5A metals formed ternary oxide corrosion products when exposed to liquid sodium containing more than 5 parts per million of oxygen. These metals and possibly their alloys, used as structural materials in high-temperature regions of liquid-metal cooled, fast-breeder reactors, would be subject to rapid corrosion at normal reactor oxygen levels, and spalling and transport to other regions of the system by the flowing liquid sodium.

A method of producing a spiral band of columbium-tin superconducting alloy around a thin columbium ribbon was reported.[17] The columbium-tin superconductor was fabricated from 0.001-inch and 0.5-inch-wide columbium ribbon. The columbium-tin material was superconductive to higher magnetic field strength, temperature, and current than most other superconductors.

Introduction of hydrogen into columbium-palladium, columbium-palladium-molybdenum, and columbium-palladium-tungsten alloys was studied for its influence on the superconducting transition temperature.[18] Most alloys tested showed at least one concentration of hydrogen that gave a higher superconducting transition temperature than that of the unhydrogenated material. The highest transition temperature discovered was 5.46 Kelvin for $(Cb_{85}Pd_{15})_9MO$ with hydrogen-metal $(H/M) = 0.51$. It was concluded that the effect of hydrogen on the transition temperature of these alloys increased as the molybdenum content increased and, therefore, the superconducting properties of molybdenum hydrides should be studied.

A flexible superconducting cable was fabricated from columbium-tin.[19] Applications for columbium-tin superconductors have been slow to develop because of brittleness and bend resistance. Fabrication of the cable involved loading pure columbium rods jacketed with tin into a copper billet. The billet was then extruded and drawn into wire. Any desired diameter cable can be produced.

Rectangular cable was produced by twisting strands of a composite copper and columbium-titanium wire around a core of soft solder and pulling the bundle through a rectangular die.[20] Superconducting magnets in particle accelerators developed greater strength and higher efficiency with the rectangular copper and columbium-titanium wire.

The preparation of tantalum metal by the open-aluminothermic reduction of tantalum pentoxide (Ta_2O_5) and purification of the tantalum by melting in an electron-bombardment furnace or by a molten-salt electrorefining process was described.[21] Tantalum metal in a consolidated form, in good yield was obtained by reduction of tantalum pentoxide with aluminum in the presence of lime, as a slag fluidizer, and potassium chlorate as a heat booster.

A process for removing lead from pyrochlore before smelting was patented.[22] Pyrochlore concentrate was mixed with calcium chloride or other applicable chlorides and heated for 30 to 120 minutes at 700° C to 1,000° C, to volatilize lead chloride, and washed with water or dilute hydrochloric acid to remove the metal chloride.

Copper

By Harold J. Schroeder [1] and George J. Coakley [1]

World mine production of copper was 7.68 million tons, a decrease of 5% and a reversal from the preceding seven consecutive annual increases. The United States continued to lead the world in mine production, followed by Chile, the U.S.S.R., Canada, Zambia, Zaire, and Poland. Among these major producers, only Poland recorded a substantial increase, where an advance of 36% moved the country from a position of 10th to 7th largest. The lower world output was a reflection of the worldwide recession that severely reduced demand. Despite the curtailed production, stocks of refined copper were built-up to record high levels and prices were consequently depressed.

In the United States, consumption of refined copper and mine, smelter, and refinery outputs were all substantially smaller for the second consecutive year. Despite the curtailed output, the components of new supply exceeded consumption with a resultant buildup of industrial refined copper stocks and price cuts totaling 9 cents for a yearend quotation of 63 cents per pound for cathode copper. Foreign trade in unmanufactured copper was at a greatly reduced level in 1974, and net imports were a relatively small supply component. For refined copper, the largest trade category, exports exceeded imports.

Table 1.—Salient copper statistics

r Revised.

Legislation and Government Programs.—The 1974 disposal of nearly 252,000 tons of refined copper reduced the inventory of refined copper in the national stockpile to 489 tons. The 7,067 tons of copper contained in beryllium-copper master alloys remained in inventory as a stockpile item.

The Office of Minerals Exploration is authorized to grant loans for up to 50% of approved costs on exploration for copper deposits. However, no loans involving copper have been awarded since 1969.

In November 1974, the U.S. Department of Commerce placed all copper raw materials, except scrap, under the Defense Priorities System. Prior to that date, only refined copper made from ores mined in the United States was subject to defense ratings. In January 1975, the Commerce Department rescinded the 5% set-aside applicable to domestic refined copper. In September 1975, the Commerce Department excluded all copper raw materials except intermediate shapes from priority ratings, thus making copper exempt from rated orders in a manner similar to that in effect prior to 1974. Defense-rated shipments of mill and foundry products were approximately 50,000 tons (copper content) in 1975.

Public Law 93–497, temporarily suspending the 0.8 cent per pound import duty on copper ores, concentrates, blister, and refined copper, expired on June 30, 1975. With the exception of July 1972–June 1973, the duty had been suspended since January 1966. A suspension of the duty on copper and copper-base scrap, however, has been continued through June 1978.

DOMESTIC PRODUCTION

Mine Production.—Domestic mine production of recoverable copper was 1.41 million tons, a 12% decline from that of 1974 and the smallest quantity since strike-disrupted 1968. Principal copper-producing States were Arizona, with 58% of the total, Utah (13%), New Mexico (10%), Montana (6%), Nevada (6%), and Michigan (5%). These States accounted for 98% of total production. Weak demand for copper and increased costs of production led to the permanent closure of several marginal underground operations, cutbacks, and temporary closures at other operating properties, and a slowdown of several new developments.

Open pit mines accounted for 80% of mine output and underground mines for 20%. The production of copper from dump and in-place leaching, mainly recovered by precipitation with iron, was 144,294 tons, or 10% of mine output. Total copper recovered by leaching methods was 231,760 tons, of which 194,495 tons was precipitated with iron and 37,265 tons was electrowon.

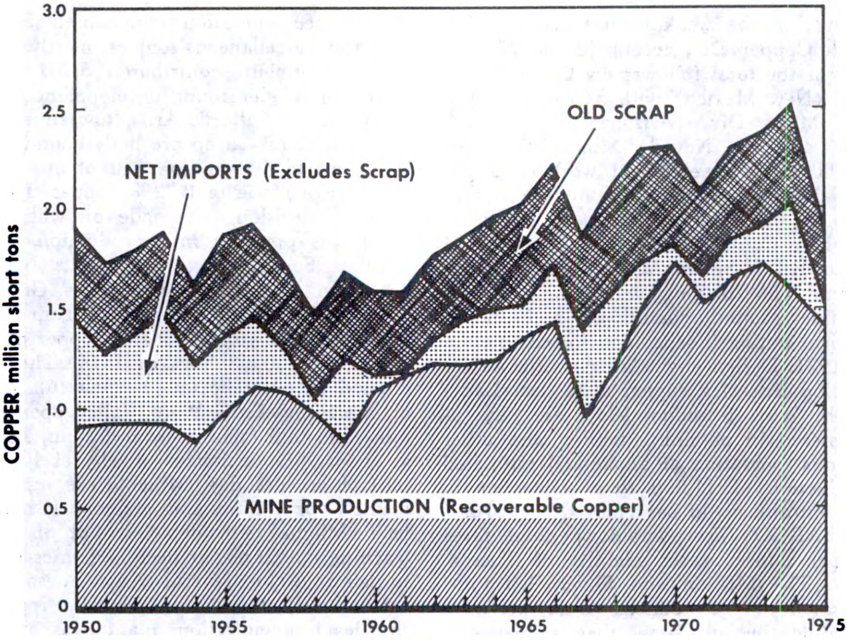

Figure 1.—Sources of copper supply for United States copper consumption.

Duval Corp., a subsidiary of Pennzoil Company, operated the Duval Sierrita open pit mine near Tucson, Ariz., milling a record 31.4 million tons of ore averaging 0.33% copper and 0.030% molybdenum. Reserves at yearend were estimated at 523 million tons grading 0.32% copper and 0.033% molybdenum. Duval also operated the Esperanza and Mineral Park copper-molybdenum open pit mines in Arizona and the Copper Canyon open pit copper mine in Nevada. These three operations milled 12.7 million tons of ore and also produced leach-precipitation copper from waste dumps. Total output from all operations was 127,721 tons of copper in concentrates and 11,170 tons of copper in precipitates.

The Anaconda Company produced 6,500 tons of copper from underground operations at Butte, Mont., compared with 17,450 tons in 1974, and reflected the phasing out of underground vein mining. Output at the Berkeley pit was 75,030 tons of copper compared with 98,890 tons in 1974. The Continental-East pit produced 12,680 tons of copper before closure in October due to depletion of ore reserves. Production of copper from the Yerington mine at Weed Heights, Nev., and the newly opened Victoria mine near Ely, Nev., totaled 41,190 tons compared with 37,970 tons in 1974. A major underground copper mine, the Carr Fork project in the Bingham District of Utah, was under development with completion scheduled for 1979. The initial rate of production was planned to be 48,000 tons per year with an increase to 56,000 tons 3 years later.

Anamax Mining Co., a joint venture of The Anaconda Company and AMAX Inc., operated the Twin Buttes, Ariz., open pit mine and produced 28,300 tons of copper compared with 40,140 tons in 1974. The 40,000-ton-per-day sulfide mill was shutdown in March to permit an intensified overburden-removal program. Startup of the 10,000-ton-per-day oxide ore leach-electrowinning plant began in August and approximately 6,700 tons of refined electrowon cathodes were produced.

Kennecott Copper Corp. operated mines in Arizona, Nevada, New Mexico, and Utah; these mines produced a combined total of 288,100 tons of copper, compared with 402,200 tons in 1974. The reduced output reflected shutdowns of from 2- to 12-week duration at the operating units because of the weak copper market. The Utah Copper Div. accounted for 171,500 tons of the total followed by Chino Mines Div. (New Mexico) with 53,200 tons, the Ray Mines Div. (Arizona) with 42,000 tons, and the Nevada Mines Div. with 21,400 tons. Development work on a potential copper deposit beneath the perimeter of the Utah Copper Division's Bingham Canyon open pit mine continued during 1975. Sinking a large shaft, underground core drilling, test mining to determine ground conditions, and metallurgical testing is scheduled for completion by 1981. Design engineering continued for development of a copper mine near Ladysmith, Wis. If undue delays are not encountered in obtaining mining and other permits, operation at an annual estimated production of 11,000 tons of copper in concentrates could be achieved by 1978.

ASARCO Incorporated operated three copper mines in the vicinity of Tucson, Ariz. The Mission and Silver Bell units operated on a reduced 5-day-per-week schedule through June, then following a 3-week vacation shutdown in July, operated on a 4-day-per-week schedule. Outputs at the two units were 26,900 tons and 18,300 tons of copper in concentrates and precipitates compared with 40,300 tons and 23,500 tons, respectively, in 1974. Production at the San Xavier mine and leach plant in the first full year of operation was 9,700 tons of copper in precipitates. The Sacaton mine and mill near Casa Grande, Ariz., also in its first full year of operation, produced 21,900 tons of copper in concentrates. Production was from an open pit but development work was underway for the mining of a deeper ore body by underground block-caving methods beginning in 1980.

Mines of the Phelps Dodge Corp. produced 249,686 tons of copper compared with 281,338 tons in 1974. The decrease reflected closure of the Lavender pit near Bisbee, Ariz., in December 1974, and the Bisbee underground mines on June 13, 1975, and reduced work schedules. These factors more than offset production from the Metcalf mine near Morenci, Ariz., which became operational in January and produced 29,195 tons of copper in concentrates, well below its 60,000-ton capacity. Output at Morenci, Ariz.; Ajo, Ariz.; and Tyron, N. Mex., was 100,775 tons, 33,025 tons, and 75,386 tons, respectively. The Bisbee operation contributed 5,600 tons and miscellaneous sources, mostly tailings retreatment, contributed 5,707 tons of copper. Underground development work continued at Safford, Ariz., toward eventual mining of a deep ore body containing an estimated 400 million tons of ore with an average grade of 0.72% copper. However, no decision was made on when to bring this property into production.

Cities Service Co., through its North American Chemicals and Metals Group, operated mines in Arizona and Tennessee that produced 46,900 tons of copper compared with 30,600 tons in 1974. The increased output reflected the first full year of operation of the Pinto Valley open pit mine and mill facilities near Miami, Ariz., at about 90% of design capacity of 40,000 tons of ore per day. Minable ore reserves of the Copper Cities and Diamond H mines near Miami were depleted but in situ leaching operations at declining rates were to continue for several years. A solvent extraction-electrowinning plant to replace the leach-precipitation plant was under construction with completion scheduled for mid-1976. Startup of the underground Miami-East mine, originally scheduled for 1976, was postponed because of escalated costs and adverse market conditions.

The White Pine, Mich., operations of White Pine Copper Co., milled a record high 9.0 million tons of copper ore averaging 1.01% copper with an 85.6% recovery of copper in concentrate. At yearend, extractable ore reserves to the present operating depth of 2,200 feet were estimated to be 94 million tons averaging 1.2% copper, assuming that 43% of the ore would be left in pillars and allowing a 9% grade dilution. Using similar assumptions, there is a probable extractable ore reserve of 128 million tons of ore averaging 1.06% copper at depths between 2,200 and 3,500 feet.

Magma Copper Co. operated two underground copper mines in Arizona with a combined output of 133,000 tons of copper in concentrate compared with 149,600 tons in 1974. Production at the San Manuel mine was reduced 23% as an adjustment to the weak copper market. At the smaller Superior mine, production was increased by 33% to achieve the best possible unit operating costs.

The Inspiration Consolidated Copper Co. operated the Thornton, Live Oak, Red

Hill, and Joe Bush open pit copper mines in the vicinity of Inspiration, Ariz.; 19.6 million tons of waste and 6.3 million tons of ore were mined for a combined 25.9 million tons of material handled. Approximately 5.4 million tons of the ore was treated in the concentrator, with about 77% of the concentrator feed first processed in leaching tanks to recover acid-soluble copper. The combined production from in-plant processed ore in the form of concentrates, precipitates, and electrowon cathodes was 34,263 tons of copper. Waste dump leaching of mined material too low in copper content for in-plant treatment yielded an additional 10,633 tons of copper. At the Ox Hide mine, 2.3 million tons of ore was mined for heap-leaching dumps and 5,053 tons of copper was recovered in the form of precipitates. At the Christmas open pit mine, southeast of Miami, Ariz., output was 5,865 tons from processing 1.4 million tons of ore and removal of 4.8 million tons of waste. Total mine production from all operating mines was 55,815 tons of copper compared with 61,238 tons in 1974.

The Cyprus Pima Mining Co. operated the open pit Pima mine near Tucson, Ariz., milling 19.6 million tons of ore averaging 0.48% copper. Delivery of 15 new 170-ton-capacity trucks to replace smaller vehicles and a third 20-cubic-yard shovel for 1976 delivery was expected to improve mine efficiency. Cyprus Bagdad Copper Co. at its Bagdad, Ariz., property mined 2.1 million tons of sulfide ore averaging 0.70% copper. In addition, 7,500 tons of cathode copper produced by a leach-electrowinning process was sold. Progress on a major mine-mill expansion program, designed to handle 40,000 tons of ore per day and planned to be completed by late 1977, included site preparation of the primary crusher and concentrator, and acquisition of 11 of 20 new 170-ton trucks and 1 of 4 20-cubic-yard shovels planned for the operation. Ore reserves at yearend were 300 million tons of proven ore averaging 0.49% copper, with additional tonnages indicated. The Cyprus Bruce Copper and Zinc Co. operated its underground copper-zinc mine near Bagdad, Ariz., and mined 94,600 tons of ore grading 3.7% copper and 12.5% zinc. The Cyprus Johnson Copper Co. completed development of an oxide-copper ore deposit near Johnson, Ariz., and production began in March. The leach-electrowinning process was expected to achieve the rated capacity of 5,000 tons of copper annually as cathodes during 1976. Reserves consist of nearly 13 million tons of oxide ore with 0.50% acid-soluble copper, which assures a life for the operation of about 9 years. An additional 10 million tons of mixed oxide and sulfide ore underlie the oxide deposit.

Ranchers Exploration & Development Corp. produced a record 7,605 tons of copper cathodes by a leaching-solvent extraction-electrowinning process at its Bluebird mine near Miami, Ariz. Lower copper prices and the unfavorable economic climate prompted the company to postpone its planned 50% expansion program. The in situ leaching operation at the Old Reliable deposit near San Manuel, Ariz., and the leaching operation at the Big Mike mine near Winnemucca, Nev., were placed on standby to await higher prices. The curtailed outputs for the year were 735 tons of copper in precipitates at the Old Reliable and 214 tons of copper in precipitates at the Big Mike.

Hecla Mining Co. in a joint venture with El Paso Natural Gas Co. continued mine development and plant construction at the Lakeshore copper mine south of Casa Grande, Ariz. The $195 million project was 95% complete and production was scheduled for early 1976, with output to gradually buildup to 65,000 tons of copper per year. Sulfide ore will be milled in a 11,000-ton-per-day concentrator with the concentrate treated by roasting, leaching, and electrowinning to produce 30,000 tons per year of cathode copper. The roasting operation will produce 200 tons per day of sulfuric acid for use in a 6,000-ton-per-day vat-leaching plant to process oxide ore. The leaching-plant output will be 35,000 tons of copper in the form of precipitate copper.

Operations at the UV Industries, Inc., Continental mine near Bayard, N. Mex., was curtailed by a 3-month strike. Output was 17,614 tons of copper in concentrate from milling 1,644,000 tons of ore averaging 1.17% copper. Reserves at yearend were 18 million tons averaging 0.86% copper suitable for open pit mining and 19 million tons averaging 1.97% copper suitable for underground mining.

Smelter Production.—Output of copper at primary smelters in the United States was 1.50 million tons, a 9% decrease from that of 1974 and the smallest quantity since 1968. The reduced production reflects curtailment of operations as an adjustment to the reduced demand for copper.

ASARCO completed water-control and dust-collection facilities to meet primary water-quality standards and to improve in-plant working conditions at its Tacoma, Wash., smelter. An air monitoring and meteorological measurement system for air quality control was placed in operation at the Hayden, Ariz., smelter. At the El Paso, Tex. smelter, design work began on a second acid plant to collect sulfur emissions from both the copper smelter and the sinter machine of the lead smelter. An agreement was reached with the State of Texas to improve fugitive emissions at ground level by enclosing completely and ventilating the building housing the converter furnaces.

Anaconda completed construction of a fluid-bed roaster and 37,000-kilowatt electric furnace complex in October. The new facility will permit greater recovery of sulfur gases and particulates and replace some of the reverberatory furnace capacity.

In August, Kennecott began operating a supplementary control system for regulating sulfur dioxide emissions at its Hurley, N. Mex., smelter. During the last 5 months of the year, curtailment of smelter operation to meet ambient air quality standards resulted in an average loss of 2 days of operation per month. The McGill, Nev., smelter was shutdown for 8 weeks during the third quarter. One week after resumption of operation, a furnace failure caused an additional 5-week curtailment. At the Garfield, Utah smelter, work continued on an extensive construction project for improved environmental controls to be completed in 1977. Included in the project will be the replacement of existing reverberatory furnaces and converters with a continuous smelting-converting unit developed by Noranda Mines Ltd. and also construction of an additional sulfuric acid plant.

Phelps Dodge essentially completed construction of a new copper smelter in Hidalgo County, N. Mex. Cost of the smelter project, including a townsite and a 36-mile industrial railroad, was estimated at $240 million. It will be the first smelter in the United States to utilize the flash smelting process. Initially, the facility will have the capacity to treat about 1,400 tons of concentrates per day, equivalent to about 100,000 tons of anode copper annually. Agreement was reached to smelt concentrates from the Cyprus Mines Corp. expanded Bagdad, Ariz., mine beginning in 1978, which requires additional construction, including a second acid plant to increase the smelter capacity.

Magma Copper Co. installed equipment and storage facilities at the San Manuel smelter to permit greater use of oil as smelter fuel during periods of natural gas scarcity. However, the increased cost of oil prompted an engineering study and search for an adequate source of coal as an alternative.

Inspiration Consolidated Copper Co. experienced several equipment failures during the first full year of operation of its new electric furnace and acid plant completed in 1974. The most serious problem was failure of the furnace wall in December. However, prior to this failure, both plants demonstrated performances at rated capacities. New copper-bearing material treated at the smelter rose from 248,000 tons in 1974 to 299,000 tons in 1975. The portion supplied from other producers' mines increased from 45% to 64%.

Refined Production.—Production of refined copper from primary materials decreased 13% to 1.44 million tons. Refined copper produced from scrap was 344,500 tons compared with 496,900 tons in 1974. Total production of refined copper in the United States was 1.79 million tons, derived 81% from primary and 19% from scrap sources.

ASARCO completed construction on a new refinery of 420,000 tons of annual copper capacity at Amarillo, Tex., and by yearend was operating at about 50% capacity. Together with the necessary infrastructure and related facilities, the project was estimated to cost on the order of $190 million and will employ 700 people. ASARCO's Baltimore refinery, replaced by the Amarillo refinery, was closed in December as planned.

An expansion project by Anaconda to increase capacity at its Great Falls, Mont., refinery by 38% to 42 million pounds per month was completed during the year. Renovation of the silver slime and solution purification circuits was in progress. General economic conditions and a lack of feed material dictated closure of the company's Perth Amboy, N.J., copper refinery, which for 40 years had been the principal processor of blister and anode copper from Anaconda's Chilean operations.

In the first full year of operation, AMAX produced 5,000 tons of refined copper at its nickel-copper-cobalt refinery at Braithwaite, La. The facility was designed to process nickel-copper matte produced by Bamangwato Concessions, Ltd. (BCL) in Botswana, as well as feed material from other sources. Capacity operation of 23,500 tons of copper per year was scheduled to be attained early in 1977.

Copper Sulfate.—Copper sulfate was produced from primary and/or secondary metal by companies with plants located as follows:

Company	Plant location
The Anaconda Company	Great Falls, Mont.
Chevron Chemical Co	Richmond, Calif.
Cities Service Co	Copperhill, Tenn.
Phelps Dodge Refining Corp	Laurel Hill, N.Y. El Paso, Tex.
Van Waters & Rogers Inc	Wallace, Idaho.

Copper sulfate production decreased 15% to 35,614 tons, the smallest quantity since 1971. Production exceeded shipments plus consumption by producing companies by 3,792 tons, and ending stocks of 6,866 tons were the highest yearend level since 1970. Of the total 31,822 tons shipped, producers' reports indicated that 16,187 tons was for agricultural uses, 15,119 tons was for industrial uses, and 516 tons was for other uses.

Byproduct Sulfuric Acid.—Sulfuric acid was produced at 12 copper smelters from the sulfur contained in offgases, and output increased for the eighth consecutive year, from 1,277,400 tons to a record 1,784,700 tons, on a 100%-acid basis. A sulfuric acid plant was under construction at the new Hidalgo County, N. Mex., smelter. Work was suspended on construction of an acid plant at the McGill, Nev., smelter pending resolution of a disagreement between the company and the Environmental Protection Agency over interpretation of applicable clean air standards.

SECONDARY COPPER AND BRASS

Domestic recovery of copper in all forms from all classes of purchased scrap totaled 971,965 tons in 1975, a 28% decrease from the 1974 total. Recovery from copper-base scrap declined from 1.32 million tons to 946,176 tons. Brass mills accounted for 43% of the recovered copper, primary producers for 29%, and secondary smelters for 23%. The remaining 5% was reclaimed at chemical plants, foundries, and manufacturers.

Consumption of purchased copper-base scrap in 1975 was 1.25 million tons consisting of 61% new scrap and 39% old scrap. Of the major categories of copper and copper-alloy products derived from scrap, the output of unalloyed copper, brass mill products, and brass and bronze ingots were 355,500 tons, 510,400 tons, and 188,200 tons, respectively.

CONSUMPTION

Consumption of refined copper dropped 30% to 1.53 million tons, a decrease for the second consecutive year and the smallest quantity since 1961. The reduced level of consumption was a reflection of the slump in construction, automobile production, and other areas of the economy which consume copper. Wire mills accounted for 69% of refined copper consumption, brass mills for 29%, and all other categories for the remaining 2%.

Apparent withdrawals of primary refined copper on domestic account was 1.31 million tons compared with 1.78 million tons in 1974, the latter figure excluding the supply component of approximately 252,000 tons released from the Government stockpiles in 1974.

STOCKS

Stocks of refined copper at primary producers increased from 101,000 tons at the start of the year to 225,000 tons by the end of June and were 207,000 tons at yearend. This was the largest yearend stock level since 1934. At wire rod mills, brass mills, other refined copper consumers, and secondary smelters there was a small increase in refined copper stocks from 150,900 to 156,100 tons during 1975. Refined copper stocks reported by the New York Commodity Exchange (COMEX) rose from 43,200 to 100,000 tons.

PRICES

The domestic price for refined cathode copper was established at 68 cents per pound on January 2, following an initiating reduction from 72 cents by one producer on December 27, 1974. A 5-cent price cut to 63 cents was effective February 1 for all producers. Between mid-June and late July, two producers decreased their quotes to 60 cents per pound but then returned to the 63 cents maintained by the others throughout the remainder of the year. Electrolytic wire bar quotations were 0.625 cent to 2 cents above quotations for cathode copper. Average quoted prices for electrolytic wire bar copper was 64.2 cents per pound for 1975 compared with 77.3 cents for 1974.

Prices on the London Metal Exchange (LME) increased from a monthly average of 54.9 cents per pound for January to 60.9 cents for March then declined to 52.2 cents for December. The average for the year was 56.1 cents compared with the record high 93.1 cents for 1974.

FOREIGN TRADE

Net imports of copper were a relatively small supply component in 1975 as imports of unmanufactured copper, excluding alloyed copper scrap, were 324,100 tons compared with 608,600 tons in 1974 while exports increased from 191,200 to 233,900 tons. Refined copper, the largest trade category, showed a net export quantity as imports dropped from 313,600 to 146,800 tons while exports advanced from 126,500 to 172,400 tons. Imports of blister copper were 89,000 tons compared with 207,800 tons in 1974. The other import categories of ore, concentrates, matte, and unalloyed copper scrap totaled 88,400 tons; the other export categories of ore, concentrates, matte, blister, unalloyed scrap, and ash and residues totaled 61,500 tons.

Exports of alloyed copper scrap, in gross weight, were 99,200 tons compared with 118,200 tons in 1974. Imports of alloyed copper scrap were 9,000 tons, gross weight, or 5,800 tons, copper content.

WORLD REVIEW

World mine production of copper dropped to 7.68 million tons in 1975, a decrease of 5%. The recession generated drop in demand, low prices and high operating costs led to production decreases of up to 15% in several of the major individual copper-producing countries. A notable exception of this trend was Poland, where a copper mine output increase of 36% moved Poland from 10th to 7th largest producer in the world. The United States continued to lead the world in mine production with 18% of the total, followed by Chile 12%, the U.S.S.R. 11%, Canada 10%, Zambia 10%, Zaire 7%, Poland 4%, the Philippines 3%, Australia 3%, Peru 2.6%, and the Republic of South Africa 2.6%.

World stocks of refined copper, as reported by the World Bureau of Metal Statistics, accumulated dramatically from 953,000 tons at the beginning of the year to 1,719,000 tons to yearend representing an increase of 80% over 1974 and 151% over 1973. The stocks included producer, consumer, and merchant inventories of 511,000 tons (including 100,000 tons in COMEX warehouses) of refined copper in the United States, 329,000 tons in Japan, 205,000 tons combined between West Germany, France, and the United Kingdom, plus 548,000 tons held in LME warehouses. The LME stocks, valued at over $600 million, have served as a key market indicator, increasing over fourteenfold from the 1973 prerecession level of 38 tons. The total world stock level represented the equivalent of a 3.5-month demand based on the average monthly western-world consumption of refined copper of 490,000 tons in 1974 or a 2.7-month demand based on the 1973 peak consumption level of 638,000 tons monthly.

In response to market conditions, the conference of Ministers of the Conseil Intergouvernemental des Pays Exportateurs de Cuivre (CIPEC), comprised of Chile, Peru, Zaire, and Zambia, met in an extraordinary seventh session in Paris, April 9–11, 1975. The decision was made to reduce copper production by 15% from April 15, 1975, and to increase export cutbacks from 10% to 15% at the same date. At the eighth annual conference of CIPEC ministers held in Lima, Peru, November 18–20, 1975, it was decided to continue the cutbacks until June 30, 1976. During the meeting, Indonesia was formally admitted as a new full member and Australia and Papua New Guinea were admitted as nonvoting associate members. As a result, CIPEC claimed to control 38% of mine production, and over 72% of internationally traded copper. Major policy decisions announced at the conclusion of the conference included a CIPEC proposal to initiate a dialogue between producing and consuming countries with a view toward negotiating a copper price stabilization agreement.

Argentina.—Cía. Minera Aguilar S.A., the Argentina subsidiary of St. Joe Minerals Corp., continued engineering and feasibility studies on the Pachon porphyry copper deposit and increased the size of reported ore reserves to 790 million tons of 0.59% copper and 0.016% molybdenum. Potential production in 1981 is dependent on the arrangement of financing.

Australia.—The Australian copper industry, hard hit by high wage and cost inflation and low copper prices, dropped mine output 13% to 241,000 tons; refined copper production increased 2% to 182,300 tons in 1975. The industry had appealed to the Government through the Industries Assistance Commission to provide assistance that would allow unprofitable producers to remain in operation until copper prices recovered. Delayed by the December elections and the resulting change in government, no action had been taken by yearend.

Mount Isa Mines Ltd., operated its copper-lead-zinc-silver mine at Mount Isa and a copper smelter at Townsville to produce a record 175,000 tons of blister copper for the fiscal year ended June 30, 1975. This output exceeded the rated productive capacity of 170,000 tons, which was the result of the expansion program completed in 1973.

The Mount Lyell Mining & Railway Co., Ltd., a subsidiary of Consolidated Gold Fields Ltd., for the year ended June 30, 1975, increased production 2% to 27,350 tons of copper in concentrate from 2.32 million tons of ore grading 1.24% copper, mined and milled at its Queenstown, Tasmania, operation. Ore production came 90% from underground operations. Reserves in all ore zones were estimated at 31.7 million tons of proven ore grading 1.5% copper and 11.4 million tons of probable ore grading 1.42% copper.

Gunpowder Copper Ltd., owned 48% by Consolidated Gold Fields and located 80 miles north of Mt. Isa, increased production 4% to 8,046 tons of contained copper. A development program was underway to double capacity to 600,000 tons of ore annually by late 1978. Reserves at Gunpowder's Mammoth mine were 8.8 million tons grading 3% copper.

Cobar Mines Pty., Ltd., owned by BH South Ltd., treated 666,300 tons of ore averaging 1.9% copper producing 10,700 tons of copper contained in 42,800 tons of concentrates. The severe economic conditions led to an announcement to cut the rate of production from 800,00 to 500,000 tons per year and to suspend all development work. Drilling prior to this decision, however, increased ore reserve estimates at the CSA, Chesney, and Gladstone ore bodies to 44 million tons. Previous estimates reported average reserve grades of 1.0% copper and 4.4% zinc.

Kanmantoo Mines Ltd., in Kanmantoo, South Australia, also held by BH South Ltd., decreased production for the fiscal year ended June 30, 1975, 16% to 6,626 tons of copper contained in 32,700 tons of concentrates recovered from 967,000 tons of copper ore milled. Due to increasing losses, BH South announced that the Kanmantoo mine would be closed in mid-1976.

Peko-Wallsend Ltd., operated the

copper-gold mine at Mount Morgan, Queensland, and the Tennant Creek copper-gold-bismuth mines in the Northern Territory. At the Tennant Creek operations, the suspension of all copper mining and smelting activities continued throughout the year. The smelter was to be kept on a care and maintenance basis through 1976. Copper production for the fiscal year ended July 8, 1975, decreased 40% to 9,800 tons. The production figures represent a full rate of production for July-December 1974, and production of byproduct copper only from the mining of gold shoots within the Juno, Peko, and Warrego mines for January–June 1975. During the 1974–75 fiscal year, Mount Morgan produced 9,100 tons of contained copper in 1.4 million tons of ore treated. Remaining reserves were estimated at 2.2 million tons grading 0.62% copper. The smelter handled 82,700 tons of concentrate feed yielding an output of 9,530 tons of blister copper. Decreasing ore grades and a major slide in the open pit in November led to a yearend decision to close down one of the two mills at Mount Morgan.

Botswana.—Bamangwato Concessions, Ltd. (BCL), operated the Pikwe open pit and underground nickel-copper mine and flash smelter and continued development work on the Selebi underground ore body. Production at Selebi must be phased in to offset the depletion of the open pit during 1979. Modifications and improvements to the plant process control areas, designed to remove production bottlenecks, were scheduled for completion by late 1976. Ownership of BCL is 15% by the Government of Botswana and 85% by Botswana Roan Selection Trust, Ltd. (BRST), which in turn is owned 40% by the public and about 30% each by AMAX and the Anglo American Corp./ Charter Consolidated, Ltd. Group.

During the year, ore milled increased 41% to 1,267,500 tons grading 1.15% nickel and 0.94% copper compared with 901,300 tons grading 1.18% nickel and 1.01% copper in 1974. Production of a 75% to 80% copper-nickel matte improved from 7,345 tons to 18,200 during the year, but was still below the 50,000-ton planned capacity. The matte product was shipped to AMAX's Port Nickel, La., plant for refining. The 16,553 tons of matte processed yielded 5,000 tons of nickel and 6,582 tons of copper.

Canada.—Mine production decreased 12% in 1975 to 798,132 tons of recoverable copper. Smelter output decreased 7% to 551,150 tons, and refinery production decreased 5% to 583,350 tons of copper. Mine production decreased in nearly all Provinces in 1975 except for New Brunswick and Newfoundland. Ontario moved ahead as the leading copper-producing Province with 37% of the total, followed by British Columbia 33%, Quebec 16%, Manitoba 9%, and the remaining Provinces 5%.

In 1975, the double burden of Federal and provincial mining tax and royalty levies were an important added factor in delaying new copper expansion and mine development programs in Canada. Changes announced or being discussed in the second half of the year indicated the mining industry could expect some easing of restrictive taxes in 1976. In particular, the Federal Government introduced a new "Resource Allowance" deduction amounting to 25% of resource production profits after the deduction of operating and capital costs. The Resource Allowance recognizes and allows for a limited deduction of provincial resource taxes and increases the tax value of incentive write-offs, such as exploration and development costs. In British Columbia, the election of a new Social Credit Government in December was expected to bring changes in the mining tax and royalty legislation, which left most mines with little or no profits in 1974 and 1975. In Manitoba and Saskatchewan, legislation passed during the year gave the provincial Governments authority to participate directly in exploration and development projects. The Yukon and the Northwest Territories, with no restrictive mining tax legislation, saw increased exploration activity relative to the other Provinces. There was also a trend, particularly in Ontario and Quebec, to provide incentives to attract an increased degree of mineral processing, smelting, and refining within the Provinces.

In British Columbia, Afton Mines Ltd., controlled 54% by Teck Corp. Ltd., announced plans in October for the only new major copper development in the Province in 1975. The $80 million mine, mill, and smelter complex will have a capacity of 25,000 tons per year of copper with construction scheduled for completion in late 1977. The smelter will be the first copper smelter to employ the new top-blown rotary-converter (TBRC) process developed by International Nickel Co. of Canada, Ltd. (INCO) and Dravo Corp. The Afton property is located only 8 miles west of Kamloops, British Columbia, on the route of the Trans Canada Highway and electric power and pipelines, which must be moved to develop the mine. The complex syenite porphyry deposit contains 34 million tons of open pit ore grading 1% copper. The heavily oxidized portion of the ore body above 500 feet is rich in native copper, which is expected to concentrate to a low-sulfur-bearing, high-grade 60%-copper product. Under an incentive program to encourage the construction of copper smelters in the Province, the British Columbia Government will provide Afton with payment of 2 cents per pound of copper produced from the smelter during its first 4 years of operation. The Province also has an option to purchase, at cost, a 5% joint-venture interest in the smelter unit, exercisable for a period of 1 year after completion of the project.

Bethlehem Copper Corp., Ltd. milled 6.5 million tons of ore grading 0.47% copper from open pit mines in the Highland Valley, and produced concentrates containing 27,300 tons of copper compared with 28,500 tons in 1974. Reserves at the operating Huestis, Iona, and Jersey mines total 56 million tons of 0.46% copper. Negotiations were underway regarding the feasibility of bringing into production the 900-million-ton 0.48%-copper ore body of Valley Copper Co., in which Bethlehem has a 20% interest. Development of the Maggie ore zone, north of Highland Valley, with indicated reserves of 200 million tons of 0.40% copper equivalent, was also delayed.

The Granduc mine of Granduc Operating Co., north of Stewart, British Columbia, operating at 60% of capacity, produced 18,700 tons of copper in concentrate from 1.6 million tons of ore grading 1.20% copper. Granduc deferred underground development work needed to make more ore available for mining after 1977. Reserves at yearend were 19.6 million tons of 1.69% copper. Engineering studies were being made to determine the feasibility of mining an estimated 11 million tons of 1.50% copper below the 2,100-foot level.

Lornex Mining Corp. Ltd., controlled by the Rio Tinto-Zinc Corp. Ltd., operated an open pit copper-molybdenum mine in the Highland Valley and produced 53,569 tons of copper and 1,542 tons of molybdenum in concentrate from 12.9 million tons of ore.

The Bell Copper Div. of Noranda Mines Ltd., in Granisle, British Columbia, mined 4.8 million tons of ore grading 0.46% copper in 1975. Concentrate output of 69,760 tons contained 18,150 tons of copper. Reserves decreased to 29.6 million tons of 0.49% copper and 0.012 ounce of gold per ton.

Brenda Mines Ltd. (50.9% Noranda), located in Peachland, British Columbia, operating one of the lowest grade porphyry copper-molybdenum mines in the world, produced a record 10 million tons of ore averaging 0.188% copper and 0.052% molybdenum yielding 16,600 tons of copper in concentrates. The initial 5-year contract with Japanese smelters was not renewed, and since mid-1975 copper concentrate was sold to North American smelters. Yearend reserves were 126 million tons of 0.176% copper and 0.047% molybdenum.

Placer Development Ltd. (33% Noranda) operated the Craigmont mine in Merritt, British Columbia, and the Gibralter mine in McLeese Lake, British Columbia, during the year. At the Gibralter mine 11.5 million tons of ore grading 0.43% copper were milled. Production of copper in concentrates was reduced 7% to 41,780 tons in response to smelter requests and the harder ore coming from the Granite Lake pit. Reserves decreased to 308 million tons, with an average grade of 0.35% copper. At Craigmont 1.97 million tons of ore grading 1.42% copper was milled. The 91,100 tons of concentrates produced contained 26,813 tons of copper, an increase of 23% over strike-affected 1974. Ore reserves of 7 million tons of 1.83% copper were sufficient to maintain operations at the 1975 level for 3 to 4 years.

Similkameen Mining Co. Ltd., a subsidiary of Newmont Mining Corp., operated its open pit mine near Princeton, British Columbia. Seriously affected by equipment problems and a 9-week strike, output for the year decreased 23% to 16,300 tons of copper in concentrate from milling 4.1 million tons of 0.46% copper ore. Expansion of the concentrator, from 15,000 to 22,000 tons of ore per day, was completed in September 1975 to permit milling an additional 7,000 tons per day of material grading about 0.25% copper. Ore reserves at yearend were estimated at 58.2 million tons averaging 0.53% copper.

Utah International Inc., rebounding from the 1974 strike, shipped approximately 58,000 tons of copper and 62,000 ounces of gold in concentrate from its Island Copper mine on the northern end of Vancouver Island in British Columbia. The mill treated 13.7 million tons of ore in 1975.

In Manitoba, Hudson Bay Mining & Smelting Co. Ltd., operated nine mines and one smelter in the Flin Flon-Snow Lake area. Approximately 1.47 million tons of ore with an average grade of 2.4% copper and 3.0% zinc were mined and milled to produce 198,308 tons of a 16.48% concentrate containing 32,680 tons of copper, a decrease of 5%. The copper smelter produced 65,445 tons of anode copper from feed supplied 48% from Hudson Bay mines and 52% from purchased concentrates. Development work continued on the new Centennial and Westarm mines with both shafts down to over 1,400 feet at yearend. High costs shutdown the Dickstone mine in August, while depletion of developed ore reserves was expected to shutdown the Schist Lake and White Lakes mines in 1976. Total ore reserves at yearend were about 17.5 million tons grading 2.77% copper, 2.8% zinc, 0.033 ounce of gold per ton, and 0.52 ounce of silver per ton.

Sheritt Gordon Mines, Ltd. operated the Fox, Lynn Lake, and Ruttan Lake mines in Manitoba with a combined output of 43,400 tons of copper in concentrates compared with 50,800 tons in 1974. Copper production was down 11% to 27,470 tons at the Ruttan open pit mine, in which 3.34 million tons of ore averaging 0.96% copper and 1.90% zinc were milled. The lower Ruttan output was attributed to high pit equipment downtime and pit slope instability problems. At the Fox underground mine, 1.0 million tons of ore averaging 1.74% copper and 1.81% zinc were milled with production of copper in concentrates decreasing 20% to 15,747 tons. Output at the Lynn Lake nickel-copper mine continued below expectations, with copper in concentrates decreasing 20% to 2,366 tons. At yearend, production plans called for reducing output by 25% at both the Fox and Ruttan mines.

The Ontario-based Falconbridge Nickel Mines Ltd. delivered 59,260 tons of copper from nine nickel-copper mines in Sudbury, Ontario, and Manibridge, Manitoba, and from five copper-zinc, copper, and iron-copper mines in Lake Dufault and Opemiska, Quebec, Sturgeon Lake, Ontario, and Tasu Harbor, British Columbia. Concentrates from the nickel-copper operations were processed at the company smelter in Sudbury and from the other copper-zinc operations at the Noranda Mines Ltd. smelter at Noranda. Due to a 10-week labor strike at Sudbury that ended on November 2, deliveries of copper from the integrated nickel operations decreased 25% to 20,357 tons. Following the strike, production was resumed at 70% of the prestrike level, as three mines, one mill, and one of two blast furnaces were shutdown and placed on standby status. Ore reserves at yearend at Sudbury and Manibridge were 89.1 million tons averaging 1.43% nickel and 0.68% copper.

Deliveries of copper from Falconbridge Copper Ltd. increased 32% to 38,900 tons as the new Sturgeon Lake Mines Ltd. began full production on February 1. The $20 million Sturgeon Lake project, with a rated capacity of 1,200 tons per day of ore, produced 7,960 tons of copper for the year. Ore reserves at yearend were calculated at 1.8 million tons grading 2.85% copper, 10.28% zinc, 1.36% lead, 5.66 ounces of silver per ton, and 0.022 ounce of gold per ton.

INCO mined 21.2 million tons of ore with an average grade of 1.40% nickel and 0.92% copper from 16 mines in Ontario and Manitoba in 1975, compared with 22 million tons of ore with an average grade of 1.39% nickel and 0.97% copper in 1974. Deliveries of copper metal from the Copper Cliff refinery decreased 9% to 167,275 tons. At yearend, INCO estimated that proven ore reserves in Canada were 415 million tons, containing 1.61% nickel and 1.04% copper. In December, production at the Victoria mine was suspended to allow the undertaking of a yearlong redevelopment program. The small Kirkwood ore body was nearly mined out and expected to close in early 1976. Development work on the new Levack East mine at Sudbury began during the year with startup scheduled for 1984.

At Mattagami Lake Mines Ltd. Mattabi mine in northwestern Ontario, the concentrator treated 1.08 million tons of ore grading 0.97% copper yielding 8,700 tons of contained copper in concentrate. Ore reserves were 9.9 million tons of 6.70% zinc, 0.74% copper, 0.70% lead, 2.62 ounces of silver per ton, and 0.007 ounce of gold per ton. Development work on Mattagami's new underground mine at Lyon Lake, in the Sturgeon Lake area, continued with initial production of 1,000 tons per day of ore scheduled to begin in 1978. Reserves at the Lyon Lake deposit were increased to 4.03 million tons of 6.66% zinc, 1.15% copper, 0.63% lead, 3.39 ounces of silver per ton, and 0.010 ounce of gold per ton.

The Geco Division of Noranda Mines Ltd., at Manitouwadge, Ontario, produced 1.6 million tons of ore grading 1.84% copper, 3.54% zinc, and 1.44 ounces of silver per ton. Concentrates produced contained 27,400 tons of copper, a decrease of 6%. Reserves at yearend were 28.1 million tons grading 1.87% copper, 3.62% zinc, and 1.52 ounces of silver per ton.

Texasgulf Canada Ltd. operated the Kidd Creek mine near Timmins, Ontario, and mined 3.63 million tons of ore in 1975, down 2% from 1974. Production was about 63% from the open pit and 37% from underground. The mine yielded 228,800 tons of a 25%-copper concentrate and 9,600 tons of a copper-silver concentrate during the year, representing only a 1% drop in production for the year. At the end of 1975, measured and indicated reserves above the 2,800-foot level were estimated at 86 million tons containing 2.70% copper, 5.92% zinc, 2.31 ounces of silver per ton, and 0.217% lead. An additional 6 million tons was classified as inferred ore. Texasgulf was proceeding with a $100 million project to increase the mine production rate from 3.6 to 5.0 million tons per year by adding a fourth 3,500-ton-per-day circuit to the concentrator and by constructing a mile-deep shaft to develop the lower portion of the ore body. An agreement was signed in mid-1975 with the Mitsubishi Metal Corp. of Japan for the process license and basic design of a continuous copper smelter and mechanized copper refinery. This system was reported to be the most environmentally sound and lowest cost pyrometallurgical copper-smelting process in existence. At an estimated cost of ov $250 million, the facility was scheduled for a late 1978 startup with an initial 100,000-ton-per-year capacity, later expanding to 130,000 tons per year. A gold, silver, and selenium slimes-processing refinery was also to be built.

Union Minière Canada Ltd., continued development of its Thierry copper deposit in the Pickle Lake, Ontario region with planned production for the second half of 1976 at an annual rate of 1.4 million tons of ore milled. Initial output will be from two small open pits, to be followed by underground mining. Proven reserves amounted to 15 million tons averaging 1.63% copper and exploration work in progress indicated further potential.

In the Northwest Territories, Texasgulf reported the discovery of an important base-metal sulfide deposit at Izok Lake, 225 miles north of Yellowknife. Drilling at the central of three zones showed 7 million tons of indicated ore containing 3.15% copper and 14.8% zinc.

In Quebec, Campbell Chibougamau Mines Ltd. failed to negotiate a new labor contract and suspended operations on May 5, 1975, accounting for the 48% decrease in copper production to 6,160 tons. Reserves remaining in the Chibougamau area mines total 10.3 million tons grading 1.72% copper and 0.045 ounce of gold per ton.

The Lake Dufault Division of Falconbridge Copper Ltd., in 1975, produced 13,084 tons of copper in concentrate. The 7% increase in production over that of 1974 was attributed to a higher grade of ore treated. Reserves at yearend were 1.86 million tons of ore grading 3.56% copper and 4.62% zinc. The Opemiska Division milled 952,000 tons of 2.02% copper in 1975 to produce 18,383 tons of copper in concentrate. Remaining reserves consist of 5.69 million tons of 2.39% copper. Shaft sinking at the Cooke mine was completed and development was in progress.

Madeleine Mines, near Ste. Anne des Monts, Quebec, milled 908,000 tons of copper yielding 9,677 tons of copper. Approximately a 4-year supply of reserves remained.

Noranda Mines Ltd. had an interest in the treatment of 49.5 million tons of ore containing 216,300 tons of contained copper from 19 copper and zinc-copper mines in Quebec, British Columbia, Ontario, and New Brunswick. Shortages of skilled miners continued to hamper a number of Noranda's operations during the year. The company's two copper smelters at Noranda, Quebec, and Gaspé Copper in Murdochville, Quebec, treated 879,700 tons of concentrates from Noranda operations and 839,500 tons of custom material from other Canadian copper mines and from overseas. The 1.7 million tons of total material treated yielded 304,200 tons of copper contained in anodes for a decrease of 10% from that of 1974. The Noranda smelter accounted for 76% and Gaspé 24% of anode production. Canadian Copper Refineries, Ltd. (CCR) in Montreal East, Quebec, operated by Noranda, is one of the world's largest copper refineries, with a rated annual capacity of 480,000 tons. In 1975, refinery production decreased 7% to 395,000 tons of copper. CCR processed the output of the Noranda smelters, the Flin Flon smelter of Hudson Bay Mining & Smelting Co. Ltd., and imported and secondary material.

Noranda's Horne Division in Noranda, Quebec, produced 344,300 tons of ore averaging 2.15% copper and 0.135 ounce of gold per ton. Reserves of 231,000 tons of 1.05% copper at the Horne mine were expected to be depleted by 1976.

Gaspé Copper Mines Ltd. (Noranda) milled 1.25 million tons of 1.19% copper ore from the Needle Mountain mine and 9.75 million tons of 0.44% copper ore from Copper Mountain mine yielding 48,000 tons of copper contained in concentrates. Reserves at the two mines were, respectively, 21.6 million tons of 1.33% copper and 201 million tons of 0.38% sulfide copper plus 33 million tons of 0.45% oxide copper.

Mattagami Lake Mines Ltd. (43% Noranda) treated, at the Mattagami Lake mine, 1.29 million tons of ore averaging 7.3% zinc, 0.62% copper, 0.86 ounce of silver, and 0.014 ounce of gold per ton, which yielded 6,000 tons of copper in concentrate. Remaining ore reserves totaled 10.8 million tons grading 8.4% zinc, 0.65% copper, 0.95 ounce of silver per ton, and 0.015 ounce of gold per ton.

Patino Mines (Quebec) Ltd., a subsidiary of the Dutch company Patino, N.V., operated or had an interest in five copper-gold mines in Quebec. Affected by a strike for the first 3½ months of 1975 and by the temporary shutdown of the Copper Cliff, Jaculet, and Portage mines, total mill production of 440,000 tons of 1.67% copper was down from the 1974 input of 859,000 tons of 1.56% copper. Metal production derived solely from the Copper Rand mine amounted to 6,900 tons of copper in concentrate, down 45% from 1974. Ore reserves at yearend were 6.2 million tons of 1.74% copper and 0.055 ounce of gold per ton. The associated company, Lemoine Mines Ltd., nearly completed its $8.6 million, 400-ton-per-day mine and mill complex, 37 miles southeast of Chibougamau, with startup scheduled for March 1976. The high-grade volcanogenic massive sulfide deposit contains reserves of 625,000 tons of 4.5% copper, 10.8% zinc, 2.7 ounces of silver per ton, and 0.138 ounce of gold per ton.

In the Yukon Territory, Whitehorse Copper Mines Ltd., owned in part by Hudson Bay and Anglo-American Corp. of Canada Ltd., mined and milled 739,000 tons of 1.51% copper ore and produced 27,700 tons of a 36% concentrate containing 9,972 tons of copper. Development work below the 1,750-foot level continued.

Chile.—Mine production for the year decreased 8% to 913,000 tons of copper as Chile continued as the world's second largest copper producer behind the United States. Production from the large mines was as follows: Chuquicamata, 335,800 tons compared with 393,200 tons in 1974; El Teniente, 257,900 tons compared with 248,500 tons; El Salvador, 89,600 tons compared with 88,200 tons; and Andina, 68,800 tons compared with 75,400 tons. Approximately 30,000 to 35,000 tons of the production decrease was accounted for by the closure of the high-cost Exótica mine for the year.

In the medium and small mine production area, Mantos Blancos decreased output 9% to 32,200 tons, Empresa Nacional de Minera (ENAMI) increased output 9% to 85,500 tons, and Disputada raised production 26% to 35,900 tons of copper.

Minera Sagasca, S.A. controlled 59% by Continental Copper & Steel Industries Inc., operated at 30% of capacity for the year and produced 6,000 tons of copper. Sagasca, due to poor oxide leach recovery rates and difficulties in meeting long term debt schedules, applied to the Chilean Government to suspend operations at yearend.

Production of blister copper at Chile's six smelters remained at 798,000 tons, the same as in 1974. Electrolytic and fire-refined copper output remained essentially constant at 590,000 tons. In 1975, Chile exported 776,000 tons of copper contained in all classes valued at US$854 million. Corporación del Cobre de Chile (Codelco) invested approximately $115 million to maintain installed capacity and to lower production costs, which during the year dropped from 51 cents to 48 cents per pound of copper. The expenditures included the expansion of the secondary grinding plant and a new molybdenum recovery plant at Chuquicamata, and an addition of the third reverberatory furnace, and expansion of the Rancagua foundry at El Teniente.

At Codelco's Andina mine, Cerro Corp. was engineering an $18 million project to expand mill capacity to produce 86,000 tons of contained copper by 1978.

Sociedad Minera Pudahuel CPA, owned by private Chilean interests, hired the U.S. firm, Holmes and Narver, as engineer and construction manager for the $40 million Lo Aguirre project near Santiago. The mine, mill, solvent extraction, and electrowinning plant complex is scheduled to start production in 1978 at an annual capacity of 22,000 tons of cathode copper. The Lo Aguirre deposit contained reported reserves of 10.4 million tons of 2.12% copper.

Of the four large ore bodies being made available for foreign exploitation under the Foreign Investment Law (DL-600) of July 1974, Noranda Mines Ltd. signed a letter of intent on Andacolla, located in Coquimbo Province, with reserves of 193 million tons of 0.75% copper and 0.15% molybdenum. Leon Tempelsman & Sons signed one for El Abra, with a minimum 770 million tons grading 0.9% copper, while the other two, Quebrada Blanca and Los Pelambres, were still in an earlier phase of negotiations.

Codelco published *El Cobre Chileno–1975,* a comprehensive 500-page book that gave a detailed property-by-property account of all aspects of the Chilean copper industry. The book reported the magnitude of Chile's copper resources at 10.2 billion tons of 1.02% copper, demonstrated and inferred reserves, plus an additional 7.3 billion tons of identified subeconomic resources averaging 0.32% copper.

Finland.—Copper output increased 7% to 42,770 tons. Principal producing mines, operated by Outokumpu Oy, were the Keretti with 14,000 tons, the Vuonos with 8,260 tons, the Pyhasalmi with 4,970 tons, the Hammaslahti with 4,420 tons, and the Vihanti with 3,620 tons.

France.—The French Government committed over $55 million during the year to establish a raw materials stockpile chiefly to purchase copper and nickel to minimize the impact of price fluctuations on domestic industries. The copper stockpile, managed by the Groupement d'Importation et de Repartition des Metaux S.A. (GIRM), is reportedly maintained at a level sufficient to cover a 2-month consumption. In 1975, refined-copper consumption in France averaged 34,000 tons per month.

Indonesia.—Freeport Indonesia, Inc., a subsidiary of Freeport Minerals Co., and operator of the 11,500-foot-high Gunung Bijih (formerly Ertsberg) copper mine in Irian Jaya, produced 68,500 tons of copper contained in 219,600 tons of concentrates, a decrease of 4% from that of 1974.

Freeport Indonesia Inc. was continuing to study the feasibility of maximizing recovery of ore by open pit mining and to appraise possibilities for underground operations. Present estimates project depletion of the mine's remaining open pit reserves between 1981 and 1983. In late 1975, the Government accepted, in principle, a plan to acquire an 8.5% interest in Freeport Indonesia, reducing Freeport's equity in Freeport Indonesia to slightly over 80%.

Iran.—Sar Cheshmeh Copper Mining Co., an Iranian Government-owned company, continued development of the copper mine and metallurgical complex in southern Iran. Design capacity of the $500 million complex is approximately 160,000 tons of copper per year with initial production scheduled for mid-1977. Anaconda, which is developing and operating the project under a technical assistance contract, reported reserves, at a 0.40% cutoff and to a depth of 500 feet, at nearly 500 million tons of ore averaging 1.13% copper and 0.03% molybdenum.

Israel.—Timna Copper Mines Ltd., operating one of the world's highest cost copper mines with a capacity of around 14,000 tons per year, ceased operations at yearend.

Japan.—Mine production of copper from the Kuroko deposits of Japan, increased 3% to 93,000 tons. Mine output contributed only 10% of the consumption of refined copper since Japan was dependent on imports for about 90% of its copper requirements. The continued recession and high cost of petroleum imports were reflected in the 14% decrease in blister copper production to 905,500 tons and the 18% decrease in refined copper output to 902,400 tons. Based on sales of refined copper, Mitsubishi Metal Corp. was the leading copper company providing 25% of the copper supply, followed by Nippon Mining Co. Ltd. (22%), Mitsui Mining & Smelting Co. Ltd. (15%), Sumitomo Metal Mining Co. Ltd. (15%), The Dowa Mining Co. Ltd. (14%), Furukawa Mining Co. Ltd. (8%), and Toho Zinc Co. Ltd. (1%).

Japan, the world's third largest consumer of refined copper, following the United States and the U.S.S.R., consumed 888,700 tons of copper, a decrease of 3% from 1974 and 33% from the 1973 record.

Restricted by the Ministry of International Trade and Industry (MITI) ban on exporting copper, in effect the full year, producers built-up stock levels at yearend to 207,000 tons, up 76% over 1974 and over 250% above 1973 levels. An additional 122,000 tons of stockpiled copper was held by Japanese merchants and consumers. At yearend, the Japanese cabinet approved approximately $100 million to fund a nonferrous stockpiling program beginning in April 1976. The Government was considering an industry request to establish the copper stockpile at a 90,000-ton level, but the limited funds made this level unlikely.

Mitsubishi, incorporating a significant breakthrough in smelter technology, brought its new Naoshima smelter into full commercial operation in 1975. The new plant, with a design capacity of 4,400 tons of copper per month, is the first commercial plant to use the Mitsubishi continuous copper smelting and converting process.

Malaysia.—The Mamut Mines Development Co., under the management of Overseas Mineral Resources Development Sabah Bhd., a consortium of seven Japanese firms, in a joint venture with the Sabah Government and other Malaysian interests, completed development of the $94 million mine-mill project near Mamut, Sabah. By yearend, technical beneficiation problems were delaying shipments of concentrates from the mill, which is rated at a capacity of 30,000 tons per year of contained copper. The dioritic porphyry and contact serpentinite ore body, discovered by the United Nations in 1965, contains reserves of 196 million tons of ore grading 0.576% copper, chiefly in the form of chalcopyrite.

Mauritania.—The Mauritania Government, which applied for membership in CIPEC, completed arrangements in April with Charter Consolidated Ltd. for the takeover of the Société Minière de Mauritania (SOMIMA) copper mine at Akjoujt. Charter will continue to operate the mine under contract to the Government agency, Société Nationale Industrielle et Minière (SNIM). Production for 1975 was estimated at around 60% of the current capacity of 24,000 tons of copper in concentrate. SNIM announced preliminary plans to build a 33,000-ton-per-year smelter at Akjoujt. Reserves were estimated at 23 million tons of 2% copper.

Mexico.—The Mexican Government passed a new mining law effective February 20, 1975, which among other items increased the compulsory percentage of Mexican capital in mining companies from 51% to 60% when their purpose is to exploit ordinary substances, and from 66% to 75% when their purpose is to exploit substances forming part of the national mining reserve. Mexican copper production decreased slightly in all areas during the year. Mine production dropped 5% to 86,200 tons, smelter output was down 2% to 84,200 tons, and refined copper was down 7% to 69,000 tons.

Industrial Minera Mexico S.A., in which ASARCO has a 34% interest, decreased the output of blister copper 7% to 35,100 tons. Exploration work continued on the large El Arco porphyry copper deposit in the Baja, California peninsula, with reserves now estimated at 770 million tons of about 0.5% copper. Development plans called for the treatment of El Arco concentrates at the proposed new La Caridad refinery complex at Guaymas.

Compañía Cuprifera La Verde, S.A., delayed construction of a $100 million, 27,500-ton-per-year copper project at the La Verde deposit at Gabriel Zamora, Michoacan, 200 miles west of Mexico City. Legal and financing problems postponed the original mid-1975 construction startup. Lytton Minerals Ltd., a Hudson Bay subsidiary, held a 48% interest in the company with the balance shared equally between the Government, Comision de Fomento Minero, and the privately held Mexican company Sociedad de Fomento Industrial, S.A. de C.V.

Compañía Minera de Cananea, S.A., operated the Cananea mine and smelter to produce 44,100 tons of copper compared with 44,400 tons in 1974. Production was hampered by labor problems and some mechanical breakdowns. An expansion program designed to achieve a capacity of 77,000 tons of copper was expected to be completed in 1976.

Cobre de Sonora, S.A. de C.V. was 70% owned by the Mexican Government and Mexican nationals, with the Government intending to acquire the remaining interests, 26.25% held by Anaconda and 3.75% by Phelps Dodge. The company has committed $128 million to develop the Santa Rosa and Pilares copper deposits in the Nacozari region of the State of Sonora with annual planned capacity of 37,000 tons of copper in concentrates.

Mexicana de Cobre S.A., 44% owned by the Mexican Government, continued development of the La Caridad porphyry copper open pit mine in Sonora. The 66,000-ton-per-day mill will be followed by a smelter and refinery complex at the port of Guaymas with a planned capacity of 175,000 tons of copper per year by late 1977. Investment costs increased from $480 to $600 million. Ore reserves were reported at 760 million tons of 0.76% copper and 0.16% molybdenum.

Panama.—The Government of Panama, in a shift in policy, broke off negotiations with Canadian Javelin Ltd. and announced that the Cerro Colorado deposit with reserves estimated at up to 2 billion tons of 0.6% copper would be developed by the Government. On August 27, 1975, the Government signed an agreement to pay Canadian Javelin $5 million in cash plus $18.6 million worth of 8% tax-free, 20-year, Republic of Panama bonds in compensation for exploration and development work already carried out on the property. In July, following open bidding, Panama selected Texasgulf Inc., in an agreement in principle to establish a joint private-Government project to exploit Cerro Colorado at a cost of about $800 million. Texasgulf would receive a 15% to 20% equity interest in the project and be responsible for the evaluation, construction, and operation of the mine.

In the Cerro Petaquilla area of Central Panama, a second major copper deposit reportedly containing an estimated 300 million tons of 0.6% copper was discovered by Cobre Panama, S.A., a consortium of Japanese mining companies.

Papua New Guinea.—On September 16, 1975, Papua New Guinea (PNG) became an independent country. As one of the new CIPEC member countries, PNG with one mine, was the world's 12th largest copper producer in 1975. Copper was expected to play an increasingly important economic role for PNG as the Ok Tedi deposit with reserves of 275 million tons of 0.85% copper and 0.02 ounce of gold per ton, and the Freida River deposit with 400 million tons of 0.45% copper were considered for development. Including a number of additional known copper prospects, this island nation possesses around the 10th largest copper resource base in the world.

Bougainville Copper Ltd., controlled 53.6% by Conzinc Riotinto of Australia Ltd. (CRA), 20% by the PNG Government, and 26.4% by the public, milled 34.3 million tons of a lower grade ore containing 0.64% copper and 0.025 troy ounce of gold per ton. Copper production decreased 6% from that of 1974, owing to the lower head grade with 657,000 tons of a 28.94% copper concentrate or 190,120 tons of contained copper. Estimated ore reserves in the Panguna ore body at the end of 1975 were 915 million tons of ore averaging 0.46% copper and 0.017 troy ounce of gold per ton. Moves for the secession of Bougainville Island from PNG were unresolved at yearend.

Peru.—Affected by the CIPEC agreement to cut production 15% and by large strike-related losses, Peruvian copper mine and smelter production decreased 15% and 11% to 197,340 and 173,081 tons, respectively. Copper exports dropped 30% to 138,900 tons of copper contained in concentrate, blister, and refined products. Refinery production, in contrast, increased 36% to 58,390 tons of electrolytic copper as Empresa Minera del Perú's (Minero Perú) new, $60 million, 165,000-ton-per-year refinery at Ilo came onstream in July, reaching full design capacity in October 1975.

Southern Peru Copper Corp. (SPCC),

Peru's largest copper operation, lost 69 days of production at the Toquepala mine and 26 days at the Ilo smelter due to strikes in 1975. Only 12.2 million tons of 1.06% copper ore were milled compared with 13.5 million tons of 1.24% copper in 1974. Blister copper output decreased to 119,600 tons from 134,400 tons in 1974. On July 1, 1975, SPCC entered into a commercialization agreement with the Government agency Minero Perú Comercial (MINPECO), under which MINPECO will take title to, and market all Toquepala production. Toquepala reserves were estimated at 238 million tons averaging 0.88% copper.

Northern Peru Mining Corp., an ASARCO subsidiary, operated the Quiruvilca mine and produced 6,200 tons of copper in concentrates compared with 7,400 tons in 1974.

Compañía Madrigal, a subsidiary of Homestake Mining Co., processed 235,700 tons of ore, up 20% from 1974, at its Madrigal copper-lead-zinc mine in southern Peru and produced approximately 11,100 tons of copper concentrates, up 4%. Ore grade averaged 1.7% copper, 2.4% lead, and 5.0% zinc. Plans are underway to increase the mill capacity from 770 to 1,100 tons of ore per day.

Most of the approximately 65,000 tons of remaining mine production came from Empresa Minera del Centro del Perú (Centromin), the State-owned mining agency, which operates one open pit and six underground copper mines, including the former Cerro Corp. holdings nationalized in 1974. Centromin is currently undertaking a $46 million expansion of the Cobriza mine and mill to increase capacity to 7,200 tons of ore per day.

Peru has embarked on a major development program to increase copper mine capacity from 245,000 tons to approximately 1,050,000 tons per year. Twelve new copper deposits with combined reserves of over 4 billion tons of ore containing over 27 million tons of copper were in various stages of construction, planning, and feasibility studies. These 12 projects were planned to establish 800,000 tons of new copper capacity at an estimated cost of over $4 billion. From 300,000 to 500,000 tons of this new capacity was expected onstream by 1980 with the remainder dependent on market conditions and financing. In addition, Minero Perú was scheduled to complete the doubling of the capacity of the Ilo refinery to 330,000 tons of electrolytic copper per year by 1977 at a cost of $85 million. Centromin was planning a $52 million project to expand La Oroya refinery capacity from 52,000 tons to 80,000 tons of electrolytic copper.

The major projects included Cuajone (SPCC and Billiton, B.V.), Toro Mocho (Centromin), and Minero Perú's Santa Rosa/Cerro Verde, Michiquillay, and Quellaveco deposits. Construction of the $656 million Cuajone mine, mill, and smelter project was on schedule with startup planned for mid-1976 at an annual capacity of 170,000 tons of blister copper. Cuajone ore reserves were estimated at 470 million tons of 1% copper. Centromin awarded a consortium of Fluor Utah Inc., Furukawa Mining Co. Ltd., Furakawa Electric Co. Ltd., and Mitsui & Co. Ltd., a contract to carry out a feasibility study on the Toro Mocho mine-smelter project, with a design capacity of 90,000 tons per year of blister copper. Located 90 miles east of Lima, Toro Mocho was planned for a 1982 startup at an estimated cost of $730 million. Reserves at Toro Mocho were estimated at 330 million tons of 0.77% copper.

The superjacent Cerro Verde/Santa Rosa deposits contain Peru's largest copper reserves. Cerro Verde, which contains 94 million tons of 0.70% copper, approximately half of which is oxide ore, overlies the giant Santa Rosa sulfide ore body with reserves of 1.3 billion tons of ore averaging 0.55% copper. Engineering work was underway on the $100 million, first-stage development of the oxide property, a copper mine with an annual capacity of 36,000 tons, scheduled for completion in 1977. The second-stage development of Santa Rosa was to add 182,000 tons of annual copper capacity and include a smelter-refinery complex to be built at Matarani. The project, scheduled for completion in 1980, would cost Minero Perú an estimated $1.3 billion.

Michiquillay, with ore reserves of 650 million tons averaging 0.72% copper, was expected to require $800 million to develop an annual concentrate capacity of 88,000 tons of contained copper by 1980. At Quellaveco, tentative plans called for a $600 million project to produce 80,000 tons of blister copper by about 1980. Reserves were estimated at 440 million tons of ore grading 0.80% copper.

Among the smaller projects, Minero Perú planned to develop the 56-million-ton, 2.0% copper Tintaya deposit. A $100 million mine-mill facility to produce 33,000 tons of copper in concentrates was planned for 1980 or later. Minero Perú, in association with Geomin of Romania, was planning to bring the 91-million-ton, 1.45% Antamina deposit into production in 1978 at a rate of 44,000 tons of copper per year at an estimated cost of $100 million. In the private sector, Mitsubishi Metal Corp. and Compañía Minera De Los Cerros Negros, a Homestake Mining Co. subsidiary, announced discovery of a deposit in the Bronce area near Pashap containing 50 million tons of ore grading 0.8% copper and 0.05% molybdenum. The companies started a feasibility study for a 20,000 to 30,000-ton-per-year operation.

Philippines.—The Philippines maintained eighth rank among world copper producers with 11 mining companies producing 249,900 tons of copper contained in concentrates and direct-shipping-grade ore. Total identified reserves of copper were estimated at 3.85 billion tons of ore with an average grade of 0.48% containing 18.5 million tons of copper. Approximately 60% of the total contained copper is located in developed deposits and 40% is awaiting development. Studies continued on the part of both industry and government on establishing smelter facilities in the country, but no firm decisions had been made by yearend. To assist the depressed industry, the Government removed the 30% premium export duties on byproduct gold and silver on January 1 and the remaining 2% export duty on copper on March 21. To decrease dependence on Japanese smelters, the Philippines began opening new markets for copper in 1975, primarily in the People's Republic of China and Eastern Europe.

Atlas Consolidated Mining & Development Corp., one of the largest copper producers in Asia, milled 25.7 million tons of 0.52% copper ore. It produced 379,100 tons of concentrates, which contained 112,540 tons of copper, up 17% from that of 1974. The company operated the Frank, Lutopan, and Biga mines on Cebu Island, Central Philippines. Atlas announced plans to develop, at a cost of $100 million, the new Carmen open pit located between the Frank and Biga pits and an associated 35,000-ton-per-day mill by early 1977. The Carmen ore body contained reserves of 352 million tons grading 0.43% copper. These reserves were in addition to the 769 million tons of 0.47% copper contained in the two operating properties. Atlas also initiated plans to construct, pending Government approval, a new $200 million smelter, refinery, and acid plant complex by 1978. The smelter will be built to handle 525,000 tons of concentrates annually. In 1975, average concentrate grade was 29.7% copper. Capacity of the refinery was planned at 144,000 tons.

Marcopper Mining Corp., a subsidiary of Placer Development, Ltd., milled 7.2 million tons of 0.58% copper ore. The copper contained in the concentrates was 38,300 tons, off 26% from 1974. Minable reserves at yearend were 95 million tons at a 0.40% cutoff and a 0.58% average grade of copper. A $43 million expansion program to increase mill capacity from 18,000 to 27,000 tons per day was largely completed by yearend.

Marinduque Mining & Industrial Corp. operated the Sipalay open pit in Negros Oriental and the Bagacay pit in Samar. At Sipalay, despite a drop in head grade from 0.66% to 0.57%, copper production for the year totaled 26,753 tons of contained copper, about the same as in 1974. Plans to increase the Sipalay mill capacity from 20,000 to 55,000 tons per day of ore were suspended until more favorable economic conditions prevail. Production at Bagacay amounted to 7,018 tons of copper contained in 28,300 tons of concentrates and, in addition, 23,700 tons of direct-shipping-grade ore. Grade of the direct-shipping ore based on reserves was 12.72% copper. Approximately 3 years of reserves remain at Bagacay. In 1975, Marinduque, Lepanto Consolidated Mining Co., and two other Philippine mining companies formed the Copper Smelter Corp. of the Philippines (CSCP). CSCP completed process and design engineering studies for a $250 million flash smelter and refinery complex to be established in Negros Occidental with a capacity of 93,000 tons of cathode copper per year plus byproduct gold and silver. Plans for the project have been submitted to the President's Copper Smelter Advisory Committee for approval and possible Government assistance.

Philex Mining Corp. increased production 3% in 1975 to 29,880 tons of copper contained in concentrates. The company operated the Santo Tomas II underground mine near Benguet, northern Luzon, with reserves of 177 million tons of ore grading 0.45% copper and 0.031 ounce of gold per ton. Mill capacity was increased from 15,400 to 26,500 tons of ore per day by July 1975.

Lepanto Consolidated Mining Co. operated the Lepanto underground mine in Mt. Province, northern Luzon, with production of 14,670 tons of copper contained in concentrates representing only 50% of the 1968–73 average output. The mill treated 899,000 tons of ore yielding 53,800 tons of concentrates. ASARCO, which normally handles the bulk of Lepanto high arsenic-antimony concentrates, reduced smelting of Lepanto feed for the last 3 months of 1975 due to the affect of U.S. arsenic air pollution regulations on its Tacoma, Wash., smelter. With a stockpile in hand of 64,000 tons of concentrates, greater than the year's production of 48,300 tons, the decision was made to suspend Lepanto operations on December 10, 1975. Reserves at the Lepanto mine were reduced at yearend to 8.3 million tons of 2.62% copper and 0.137 ounce of gold per ton. Legal claim problems delayed engineering feasibility studies on Lepanto's Hinobaan deposit in Negros Occidental. Reported reserves at Hinobaan by yearend were increased to 155 million tons of 0.5% copper.

Western Minolco, in the first full year of operation at its Boneng and Lobo ore bodies at Benguet, northern Luzon, produced 38,075 tons of concentrates from 4.3 million tons of ore milled in 1975 containing 9,350 tons of copper. An expansion program was started to increase the initial mill capacity of 16,500 tons of ore per day to 33,000 tons of ore per day, equivalent to about 50,000 tons of contained copper annually by 1976. Combined ore reserves at Boneng-Lobo were estimated at 108 million tons of 0.48% copper.

Poland.—In 1975, ore mined totaled 18.7 million tons yielding 297,600 tons of copper, an increase of 36% over 1974. Copper mine production came mainly from three underground mines, Lubin, Polkowice, and Rudna, all located in the sedimentary Kupferschiefer beds of the Legnica-Glogow copper region. A new smelter was planned for this region as copper production was planned to increase 20% annually. Poland's copper development program was based on reserves which increased fourteenfold since 1954, and including one deposit being exploited in the Lubin area, described as one of the world's largest copper deposits.

Rhodesia, Southern.—M.T.D. (Mangula) Ltd., a Messina Transvaal subsidiary, during the year ending September 30, 1975, produced 14,900 tons of copper in concentrates and precipitates from the Mangula mine about 80 miles northwest of Salisbury. Concentrates containing 14,900 tons of copper were produced from milling 1.4 million tons of sulfide ore. Precipitates containing 2,200 tons of copper were produced from treating 377,000 tons of an oxidized ore in the leach plant. Leach plant operations were closed at yearend due to the exhaustion of oxide reserves. Proven sulfide ore reserves were 16.5 million tons averaging 1.24% copper. The Norah and Silverside mines produced an additional 3,040 tons and 1,820 tons, respectively, of copper in concentrates. Proven ore reserves were 3.26 million tons of 1.21% copper at the Norah mine and 515,000 tons of 1.67% copper at the Silverside mine.

Lomagundi Smelting and Mining Ltd., also a Messina Transvaal subsidiary, produced 1,930 tons of copper in concentrate from mining and milling 282,200 tons of 0.95% copper ore from the Alaska mine. The Shackleton mine yielded 11,440 tons of copper in concentrate from 691,000 tons of 1.75% copper ore. Proved reserves at yearend were 500,000 tons of 1.18% copper at the Alaska mine and 1.7 million tons of 1.94% copper at the Shackleton mine. The Gwai River mine produced 536 tons of copper in concentrate from mining and milling 75,000 tons of 0.78% copper ore. The mine was placed on a care and maintenance basis in March 1975. Only 207,000 tons of 1.00% proven copper reserves remained.

South Africa, Republic of.—O'okiep Copper Co., Ltd., a subsidiary of Newmont Mining Corp., mined and milled 2.6 million tons of ore with an average grade of 1.38% copper, which yielded 33,800 tons of blister copper compared with 35,800 tons in 1974. Ore reserves at O'okiep mines at the end of 1975 were estimated at 29.5 million tons averaging 1.62% copper. Adverse market conditions forced the shutdown of two mines and one of three mills by the company. O'okiep and the Tsumeb Corp. Ltd. (South-West Africa) continued to defer construction of a new 130,000-ton-per-year electrolytic copper refinery in the Capetown area to refine the smelter output of the two companies.

Palabora Mining Co. Ltd., assisted by good demand for copper in South Africa, produced 101,200 tons of copper, a 1% increase over that of 1974. The ore milled, 21 million tons of 0.56% copper, was equal to the 1974 level. A major, $100 million expansion of the open pit mining and ore processing facilities was underway with completion expected early in 1977. Milling capacity was to be increased from an average 58,000 tons to 82,000 tons of ore per day, equivalent to 138,000 tons of copper annually. The capacity of the electrolytic refinery will be increased to handle the entire copper output, allowing Palabora to retain its position as one of the lowest cost copper producers in the world.

Messina (Transvaal) Development Co. mined and milled 1.13 million tons of 0.94% copper ore from its Messina mine, which yielded 10,450 tons of copper in concentrate. The tonnage of proved ore reserves at yearend was estimated at 5.4 million tons averaging 1.40% copper.

South-West Africa, Territory of.—The Tsumeb Corp. Ltd. mined 467,000 tons of ore from the Tsumeb mine averaging 4.27% copper, 9.73% lead, and 2.47% zinc. At the Kombat mine 337,200 tons of ore grading 1.31% copper and 2.17% lead was milled. The Matchless mine, near Windhoek, produced 112,600 tons of higher grade ore averaging 2.72% copper. Smelter production at Tsumeb was 40,100 tons of blister compared with 51,400 tons in 1974. Approximately 35% of this total was from smelting of toll and custom concentrates. The smelter was expanded during the year to handle an additional 140,000 tons per year of toll and custom concentrates from other mines in South-West Africa. Combined ore reserves at the end of 1975 were estimated at 8.9 million tons averaging 4.24% copper, 5.76% lead, and 1.30% zinc for the Tsumeb, Kombat, and Matchless mines and the Asis Ost and West ore bodies, recently discovered adjacent to Kombat.

Oamites Mining Co. (Proprietary) Ltd. (75% Falconbridge) milled 626,100 tons of ore grading 1.31% copper. Metal recovery in 21,000 tons of concentrate was 93.40% yielding 7,553 tons of copper, an increase of 8% over 1974. The increase, offsetting the lower tonnage mined, was attributed to improved grade and mining control and higher metallurgical recovery.

Spain.—Rio Tinto Patiño S.A. (RTP), operated the Cerro Colorado open pit mines and a custom smelter-refinery complex in the southern province of Huelva in 1975 and the Santiago open pit mine in northwest Spain, which started up in June 1975. The Santiago mine, with an annual design capacity of 7,900 tons, in its first 6 months of operation, treated 787,000 tons of ore yielding 4,850 tons of copper. At Cerro Colorado, despite a 7% increase in ore treated to 3.26 million tons, total copper production decreased 10% to 21,600 tons. Ore reserves remaining include 70 million tons of 0.64% copper at Cerro Colorado and 20 million tons of 0.68% copper at Santiago. A major expansion program was completed during the year at Huelva with the opening of a new flash smelter and a second acid plant in September, increasing anode copper capacity to 93,000 tons annually.

The RTP smelter produced 61,000 tons of anode copper from primary feed and 57,900 tons from secondary sources. The expanded electrolytic refinery, with a capacity of 116,000 tons, produced 88,600 tons of refined copper compared with 80,800 tons in 1974.

Andaluzia de Piritas, S.A., began initial production from the Aznacolla mine in southern Spain in mid-1975. The $170 million mine-mill development will have a capacity of 14,000 tons of contained copper annually. Reserves in the complex pyritic and cupriferous shale ore deposit were estimated at 86 million tons of about 0.44% copper.

Sweden.—Boliden Aktiebolag, which produces essentially all of Sweden's blister and refined copper, announced plans to expand the capacity of the Ronnskar smelter-refinery complex to 94,000 tons per year by 1978 and to 110,000 tons per year at a later date, at a total estimated cost of $200 million.

U.S.S.R.—In 1975, the Soviet Union produced an estimated 1,019,000 tons of copper, including 843,000 tons of primary and 176,000 tons of secondary copper. An estimated 227,000 tons of this output was exported in 1975. The Kazakstan copper industrial region continued to be the main center of copper production having increased refined metal production 50% during the 1971–75 period with an additional 25% increase called for under the 1976–80 5-year plan. While a shortage of ore was experienced at the Balkhash and Dzhezhazgan complexes within Kazakstan, the small Sayak-III porphyry copper open pit mine at Balkhash was completed, and development work at the No. 65 mine, within the large, sedimentary 1.6% to 1.9% copper-sandstone deposits of Dzhezhazgan, was begun during the year. Scheduled for completion by 1980 in Kazakstan are the new Akchu-Spassk, Dzheladinsk, Kargalinsk, Orlovsk, and the polymetallic Irtysh mines, and the expansion of the Tishinenk and Annensk mines.

In the Urals, the second largest copper-producing region, a prolonged lag in exploration and mine development created an imbalance between mine and smelter production. The Urals mines can supply only two-thirds of the concentrate feed for the Krasnouralsk, Kirovograd, and Karabash smelters, with the remaining feed requirements transported in at higher costs. Mine expansion and development programs were near completion or underway at Gaysk, Orenburg Oblast, and Bashkir.

In Uzbekstan, development of the Sary-cheku copper mine, in the Almalyk porphyry copper mine and flash smelter complex, was completed in 1975. At the Norilsk copper-nickel complex in Siberia, three Finnish firms were constructing an Outokumpu-design flash smelter capable of treating 600,000 tons of copper concentrate annually. The Soviet Government is currently soliciting bids from western firms for a 110-ton-per-day pilot plant to test the Udokan sedimentary copper deposit in eastern Siberia. The deposit was reportedly one of the largest copper reserves in the world with reserves estimated at over 1.3 billion tons of ore containing an average copper content of about 2%, approximately 20% in the oxide form. Rio-Tinto Zinc has submitted bids on the pilot plant and Earth Resources Co. (ERC), was negotiating with the Soviet Union on the licensing of a patented flotation developed by ERC for improving the recovery of copper from similar sedimentary oxide ores at the Nacimiento, N. Mex., mine. The Udokan deposit has the potential for producing up to 440,000 tons of refined copper per year. Development of another major mining complex was also underway on the porphyry copper-molybdenum deposit at Erdenet, Mongolia.

Yugoslavia.—Estimated primary production of copper by Rudarsko Topionicarski Bazen (RTB), Bor, Serbia, included 126,700 tons of copper in concentrates, 178,600 tons of blister copper, and 136,600 tons of refined copper. RTB operated a mine, flotation plant, and smelter at Bor, and a mine and flotation plant at Majdanpek. Expansion of the Majdanpek mill to handle 12 million tons of ore annually was completed during the year. Development work continued on the large 660-million ton, 0.5% copper deposit at Krivelj with plans for an annual capacity of 66,000 tons of copper, to be reached by 1981. Work also continued on the development of the second major copper-producing facility in Yugoslavia at Bucim, near Radoviste, Macedonia. Work on a mine and beneficiation plant at the Bucim copper deposit continued during the year and was scheduled to reach an annual capacity of 23,000 tons of copper in concentrates by 1977.

Zaire.—Mining the highest grade copper ore in the world with an average reserve content in producing mines of 3.83% copper, Zaire produced 547,100 tons of copper, less than 1% below that of 1974. Disruptions caused by the closure of the Benguela railroad from Shaba Province to the Angolan port of Lobito, as a result of the Angolan Civil War, had a strong impact on the economy and copper industry of Zaire in the latter part of 1975. According to CIPEC statistics, Zaire was able to export only 68% of 1975 copper production. With the loss of the Benguela railroad, which normally handles 38% of Shaba's imports and 61% of its exports, primarily mineral, alternative overland trade routes were established. Zairian copper was redirected through Zambia to the Mozambique port of Beira and via the newly opened Tanzania-Zambia Railway (Tazara), to the port of Dar es Salaam.

The Government mining agency, La Générale des Carrières et Mines du Zaire (Gécamines), which operated 10 mines, 5 mills, 1 copper smelter at Lubumbashi, and 2 copper-cobalt refineries at Shituru and Luilu in Shaba Province, produced 510,860 tons of copper including 160,750 tons of blister and 335,650 tons of copper refined shapes. Plans to increase annual production of copper to 628,000 tons by 1978 were still on schedule. Plans called for the construction of a 138,000-ton-per-year flash smelter and a 100,000-ton-per-year electrolytic copper refinery, all near Kolwezi, Shaba. As part of the expansion program, two new, open pit mines at Dikuluwe and Mashambe, with combined reserves estimated at 171 million tons of 4.1% copper and 0.3% cobalt, opened in late 1975 but operated at a low rate due to diesel fuel shortages. The Gécamines refinery at Lubumbashi was also scheduled to be expanded from 143,000 tons per year to 176,000 tons per year by 1980.

The joint Zairian Government-Japanese company Société de Dévelopement Industriel et Minière du Zaire (SODIMIZA), operated the Mushoshi mine and mill in Shaba Province increasing mine production 12% to 1.68 million tons of ore in 1975. Production of 103,950 tons of concentrate with an average copper content of 34.4% yielded 35,760 tons of contained copper. SODIMIZA continued development of the Kinsenda mine during the year but production is not expected to begin before 1978.

Société Minière de Tenke Fungurume (SMTF), controlled by the Republic of Zaire (20%) and a consortium comprised of Charter Consolidated Ltd. and Associated Companies (28%), AMOCO Minerals Co. (28%), Mitsui and Co. Ltd. (14%), Bureau de Recherches Geologiques & Miniéres (3.5%), Omnium des Mines, S.A. (3.5%), and Leon Templesman & Son Inc. (3%), made substantial progress on the construction and development of the Tenke-Fungurume project up until August 1975. At that time regional fuel shortages and serious financial support problems threatened the continuation of the project. By yearend, consideration was being given to suspending work on the 165,000-ton-per-year mine-electrowinning refinery complex originally scheduled for completion in 1977 with cost estimates that increased from $600 million to $900 million.

Zambia.—The Government assumed full operational control over the Zambian copper industry during the year as the management and sales contracts with both AMAX Inc., and the Anglo-American Corp. of South Africa Ltd. were terminated. AMAX is to receive compensation of $34 million owing to the contract termination. A new Metal Marketing Corp. of Zambia, Ltd. (Memaco), has been set up to handle all copper sales on behalf of the Government. Low prices and export transportation problems precipitated by the Angolan Civil War left the industry in serious financial difficulties. The closure of the Benguela railroad to the port of Lobito, Angola, in August caused the declaration of "force majeur" on 20% of copper deliveries from early September with Roan Consolidated Mines Ltd. (RCM) increasing it to 30% and Nchanga Consolidated Copper Mines Ltd. (NCCM) to 40% in October. The new Tazara railroad began operations on a limited basis in September with shipments of copper to the port of Dar es Salaam. Mine production in 1975 decreased 3% to 746,200 tons of recoverable copper, and blister and refined copper output decreased 7% to 693,500 tons.

RCM mined 17.5 million tons of ore with an average grade of 2.01% yielding 318,100 tons of copper during the year from the Mufulira, Luanshya, Chambishi, Chibuluma, and Kalengwa mines. RCM also operated two smelters at Mufulira and Luanshya that produced 311,650 tons of anode copper. The Mufulira and Ndola Copper refineries produced 344,600 tons of copper cathodes, 304,200 tons of which was cast into wirebars. The electrowinning plant at Chambishi produced 16,270 tons of leach cathodes. Poor ground conditions continued to cause difficulties at Mufulira and Luanshya; production was suspended for 4½ months at Chambishi to concentrate on overburden stripping. Work continued on a $200 million development program to expand mine production at the Baluba section of Luanshya, Chibuluma, and Chambishi; to extend the Chambishi leach plant; and to build an anode slimes treatment plant at Ndola. Development of the Kalushi East mine has been deferred. Ore reserves at all RCM mines are estimated to total 375 million tons of ore with an average grade of 2.96% copper. The Mufulira and Luanshya mines contain 79% of this reserve total.

NCCM for the year ended March 31, 1975, produced 450,473 tons of finished copper from operations at its Rokana, Konkola, and Chingola mine divisions, its smelter-refinery complex at Kitwe, and from the refinery at Chingola. At the Rokana division, mine output increased 8% to 157,500 tons of copper. The 14,000-ton-capacity Mindola open pit and oxide treatment plant were placed on a care and maintenance basis at the end of 1975 while expansion of the Mindola underground operations continued. At the Konkola division, mine production decreased 5% to 57,870 tons. Production of copper at the Chingola division decreased 4% to 366,180 tons, 60% of this from five open pit operations. A major low-grade tailings leach plant completed its first year of operation in April 1975 with low copper recovery rates still a problem. NCCM controls 578 million tons of ore reserves averaging 3.20% copper with 43% of these held within the Chingola division.

TECHNOLOGY

A study of porphyry copper occurrences in the Southwestern Pacific Island arc areas showed that, compared with Western Hemisphere porphyries, the deposits are geologically younger and have less discrete zones of alteration.[2] A similar study of copper porphyry occurrences in the Northern Caribbean region compared the associated intrusive rocks with those of the Southwest Pacific and continental porphyry deposits.[3] The generally assumed inverse tonnage-grade relationships for porphyry copper deposits have been challenged and, if true, have important implications for total resource estimates and future mining grades.[4]

A microscopic study on samples from a drill core yielded a detailed analysis of the mineralogy and paragenesis of a portion of the copper-nickel deposition in northern Minnesota.[5] Geologic descriptions of a porphyry copper deposit and several massive sulfide copper deposits were published.[6]

The technology and economic evaluation of processing ocean nodules, using hydrometallurgical techniques, was published.[7] Another article described the use of a pyrometallurgical method as an alternative approach for processing the nodules.[8] Use of petrography as an important tool to evaluate processing options for copper ores was described in an article on the subject.[9]

A pilot-scale test on injection of oxygen into a near dormant leach resulted in a significant reactivation of the leaching with the improvement attribute to stimulation of bacterial action, better oxidation, and increased permeability.[10] Experiments on crushing and sizing of copper-containing mine strip waste with the fines treated by flotation and the coarse treated by leaching resulted in a 71% copper recovery, compared with a 48% recovery by leaching the unsized material.[11] Field tests on fragmenting a copper deposit for potential in situ leaching showed suitable fragmentation for the tests of 15-, 20-, and 25-foot spacings to a depth of 110 feet.[12]

Cyprus Mines Corp. reported promising results from demonstration plant tests in the continuing development of its Cymet hydrometallurgical process for treating copper sulfide concentrate. New procedures eliminated the electrorefining circuit and yielded a high-purity copper with a reduction from a high power consumption of 3.5 to less than 1 kilowatt-hour per pound of copper produced. Preliminary engineering and economic studies indicated that the process may result in a significant saving in capital and operating costs compared with conventional pyrometallurgical processes.[13]

Several review articles[14] evaluated developments in hydrometallurgy with respect to the relative economics of copper production and efficiencies of environmental controls. Another article presented information on the application of stainless steel as containment vessels and other equipment in hydrometallurgy.[15]

Research has shown that sulfur in copper concentrate can be converted into insoluble anhydrite by roasting the concentrate with lime. After leaching the calcine to recover the metal values, the residues may be discarded without harm to the environment.[16] Laboratory tests on copper concentrate utilizing a combined nitrogen roast—two stage leach—electrowinning approach show promise as a process for recovering copper, sulfur, iron oxide, and valuable minor metals with a minimum impact on the environment.[17] Recent research has improved on procedures to recover copper and iron from a leach solution and to recover sulfur from the residue resulting from a ferric chloride leach of chalcopyrite concentrate.[18] Chlorination rates of sulfide minerals for application to hydrometallurgy processes were determined and analyzed.[19] Research on the application of solvent extraction to alkaline leach solutions was published.[20] An article described the initial phase of a study to recover copper and elemental sulfur from copper concentrate by using a sulfur dioxide pressure leaching process.[21]

An article reviewed the history of reverberatory-converter smelting and the emerging new smelting processes in response to tightening energy supplies and stringent environmental controls.[22] Investigations by the Smelter Control Research Association to control sulfur dioxide emissions were described in an article with particular emphasis on the promising ammonia double-alkali process.[23] Bench-scale tests were conducted to demonstrate the use of hydrogen for a direct-reduction process of recovering copper from copper concentrate.[24]

A paper reviewed the theory of the electrocrystallization of copper and extrapolated the fundamental conclusions to practical problems in the electrodeposition of copper.[25] Other research determined parameters of resistance and current distributions in copper refinery tankhouses.[26] An article reviewed the economic and technical advantages causing a greater application of the use of titanium cathodes in the starter sheet sections of copper refineries.[27]

Results of a study to identify and assess the relative importance of factors affecting the supply and demand of secondary copper were made available.[28]

Table 7.—Mine production of recoverable copper in 1975, by method of treatment

Method of treatment	Ore treated (thousand short tons)	Recoverable copper		Remarks
		Thousand pounds	Percent yield	
Copper ore:				
By concentration	239,614	2,295,390	0.48	See table 9.
By smelting	357	13,202	1.85	See table 10.
By leaching	23,032	[1]174,932	.38	See table 11.
Total	263,003	2,483,524	.47	
Dump and in-place leaching	--	288,587	--	See table 11.
Miscellaneous from cleanup, tailings, and noncopper ores	--	54,622	--	
Total	XX	2,826,733	XX	

XX Not applicable.

[1] Includes 74,529,804 pounds of electrowon copper.

Table 8.—Copper ore shipped directly to smelters or concentrated in the United States, by State in 1975, with copper, gold, and silver content in terms of recoverable metal

State	Ore shipped or concentrated (thousand short tons)	Recoverable metal content				Value of gold and silver per ton of ore
		Copper		Gold (troy ounces)	Silver (troy ounces)	
		Thousand pounds	Percent			
Arizona	151,427	1,360,839	0.45	82,385	6,155,669	$0.27
Colorado	4	81	1.01	223	37,851	55.10
Idaho	123	1,294	.53	36	37,877	1.39
Michigan	9,083	147,380	.82	--	632,336	.31
Montana	19,262	140,057	.36	13,317	2,151,969	.61
Nevada	11,674	117,102	.50	33,288	701,940	.73
New Mexico	19,401	241,481	.62	12,634	660,505	.26
Tennessee [1]	1,635	20,083	.61	W	52,197	.15
Utah	27,380	279,381	.51	W	W	W
Other States	33	894	1.31	[2]183,737	[2]1,702,301	[2]1.36
Total [3]	239,971	2,308,592	.48	325,620	12,132,645	.44

W Withheld to avoid disclosing individual company confidential data; included in "Other States."

[1] Copper-zinc ore.

[2] Includes data for Utah.

[3] Data may not add to totals shown because of independent rounding.

Table 9.—Copper ore concentrated [1] in the United States, by State in 1975, with content in terms of recoverable copper

State	Ore concentrated (thousand short tons)	Recoverable copper content	
		Thousand pounds	Percent
Arizona	151,168	1,348,042	0.39
Colorado	2	29	.69
Idaho	123	1,294	.53
Michigan	9,083	147,380	.82
Montana	19,261	140,047	.36
Nevada	11,674	117,102	.50
New Mexico	19,366	241,437	.62
Tennessee [2]	1,635	20,083	.61
Utah	27,319	279,095	.51
Other States	33	881	1.33
Total	239,614	2,295,390	.48

[1] Includes following methods of concentration: "Dual process" (leaching followed by concentration); "LPF" (leach-precipitation-flotation); and froth flotation.

[2] Copper-zinc ore.

Table 10.—Copper ore shipped directly to smelters [1] in the United States, by State in 1975, with content in terms of recoverable copper

State	Ore shipped to smelters		
	Short tons	Recoverable copper content	
		Pounds	Percent
Arizona	258,877	12,796,668	2.47
Colorado	1,598	52,349	1.64
Montana	524	10,195	.97
New Mexico	35,209	43,755	.06
Utah	60,556	286,613	.24
Other States	339	12,181	1.80
Total	357,103	13,201,761	1.85

[1] Primarily smelter fluxing material.

Table 11.—Copper precipitates (from dump or in-place leaching) shipped directly to smelters and copper ore and tailings leached (heap, vat, or tank) in the United States, by State in 1975, with content in terms of recoverable copper

State	Precipitates shipped (short tons)	Recoverable copper content (pounds)	Ore leached (short tons)	Recoverable copper content (pounds)	Percent
Arizona	85,170	111,696,353	[1] 17,229,313	[2] 147,000,303	0.43
California	1	595	--	--	--
Montana	24,211	35,799,798	--	--	--
Nevada	12,412	16,715,334	5,802,219	27,931,898	.24
New Mexico	32,957	50,028,236	--	--	--
Utah	45,997	74,347,077	--	--	--
Total	200,748	288,587,393	23,031,532	174,932,201	.38

[1] Includes 9,934,979 short tons of ore leached for electrowinning, and excludes newly generated tailings.

[2] Includes 74,529,804 pounds of electrowon copper.

Table 12.—Copper ore smelted and copper ore concentrated in the United States, and average yield in copper, gold, and silver

Year	Smelting ore		Concentrating ore		Total				
	Thousand short tons	Yield in copper (percent)	Thousand short tons [1,2]	Yield in copper (percent)	Thousand short tons [1]	Yield in copper (percent)	Yield per ton in gold (ounce)	Yield per ton in silver (ounce)	Value per ton in gold and silver
1971	453	1.76	222,121	0.56	242,656	0.55	0.0022	0.059	$0.18
1972	484	1.68	248,663	.55	266,831	.55	.0019	.059	.21
1973	337	1.40	272,688	.53	289,998	.53	.0018	.058	.32
1974	305	1.26	269,016	.50	293,443	.49	.0014	.048	.45
1975	357	1.85	239,614	.48	263,003	.47	.0014	.051	.44

[1] Includes some ore classed as copper-zinc and minor amount of tailings (1971 excludes tailings).

[2] Excludes tank or vat and heap leaching. (See tables 7 and 11.)

Table 13.—Copper produced by primary smelters in the United States

(Short tons)

Year	Domestic	Foreign	Secondary	Total
1971	1,470,815	29,181	66,333	1,566,329
1972	1,649,130	41,263	69,017	1,759,410
1973	1,705,065	38,898	77,815	1,821,778
1974	1,532,066	37,750	79,543	1,649,359
1975	1,374,324	72,804	49,357	1,496,485

Table 14.—Primary and secondary copper produced by primary refineries in the United States

(Short tons)

	1971	1972	1973	1974	1975
PRIMARY					
From domestic ores, etc.:[1]					
Electrolytic	1,274,084	1,520,943	1,536,819	1,298,712	1,171,726
Lake	57,218	70,025	78,179	66,624	70,549
Casting	79,221	89,444	83,339	55,569	43,914
Total	1,410,523	1,680,412	1,698,337	1,420,905	1,286,189
From foreign ores, etc.:[1]					
Electrolytic	167,213	160,781	159,786	202,127	154,558
Casting and best select	14,046	32,040	10,365	31,626	2,631
Total refinery production of primary copper	1,591,782	1,873,233	1,868,488	1,654,658	1,443,378
SECONDARY					
Electrolytic[2]	323,913	341,581	377,523	398,976	265,413
Casting	18,599	16,667	14,290	13,543	5,467
Total secondary	342,512	358,248	391,813	412,519	270,880
Grand total	1,934,294	2,231,481	2,260,301	2,067,177	1,714,258

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as accurate separation is not possible at this stage of processing.

[2] Includes copper reported from foreign scrap.

Table 15.—Copper cast in forms at primary refineries in the United States

	1974		1975	
	Thousand short tons	Percent	Thousand short tons	Percent
Billets	101	5	61	3
Cakes	132	6	67	4
Cathodes	661	32	765	45
Ingots and ingot bars	172	8	132	8

Total	2,067	100	1,714	100

Table 16.—Production, shipments, and stocks of copper sulfate

(Short tons)

Year	Production		Shipments	Stocks Dec. 31[1]
	Quantity	Copper content		
1971	34,648	8,662	36,852	5,936
1972	38,052	9,513	37,964	5,828
1973	43,360	10,840	44,092	4,580
1974	42,092	10,523	43,598	3,074
1975	35,614	9,204	31,822	6,866

[1] Some small quantities are purchased and used by producing companies, so that the figures given do not balance exactly.

Table 17.—Byproduct sulfuric acid[1] (100% basis) produced in the United States
(Short tons)

Year	Copper plants[2]	Lead plants	Zinc plants[3]	Total
1971	803,284	971,946		1,775,230
1972	1,010,614	859,103		1,869,717
1973	1,088,322	146,591	819,537	2,054,450
1974	1,277,440	132,594	830,969	2,241,003
1975	1,784,744	129,756	711,769	2,626,269

[1] Includes acid from foreign materials.
[2] Excludes acid made from pyrites concentrates.
[3] Excludes acid made from native sulfur.

Table 18.—Secondary copper produced in the United States
(Short tons)

	1971	1972	1973	1974	1975
Copper recovered as unalloyed copper	429,095	447,409	484,623	513,308	355,512
Copper recovered in alloys[1]	771,025	853,564	892,534	831,012	616,453
Total secondary copper	1,200,120	1,300,973	1,377,157	1,344,320	971,965
Source:

[1] Brass-mill stocks include home scrap; purchased scrap consumption assumed equal to receipts, so lines in brass-mill and grand total sections do not balance.

[2] Negative receipts indicate shipments greater than receipts.

[3] Of the totals shown, chemical plants reported the following: Unalloyed copper scrap, 1,214 tons new and 1,391 old.

[4] Includes refinery brass.

Table 24.—Consumption of copper and brass materials in the United States by principal consuming groups

(Short tons)

Year and item	Primary producers	Brass mills	Wire mills	Foundries, chemical plants, and miscellaneous users	Secondary smelters	Total
1974:						
Copper scrap	602,832	710,889	--	79,481	384,327	1,777,529
Refined copper [1]	--	670,158	1,474,340	40,486	9,184	2,194,168
Brass ingot	--	23,902	--	[2] 260,828	--	284,730
Slab zinc	--	170,669	--	3,631	7,268	181,568
Miscellaneous	--	--	--	200	13,167	13,367
1975:						
Copper scrap	372,505	518,364	--	60,098	301,601	1,252,568
Refined copper [1]	--	488,970	1,061,255	29,800	4,483	1,584,508
Brass ingot	--	5,645	--	[2] 188,669	--	194,314
Slab zinc	--	106,942	--	2,084	6,300	115,326
Miscellaneous	--	--	--	150	12,717	12,867

[1] Detailed information on consumption of refined copper will be found in table 28.

[2] Shipments to foundries by smelters plus decrease in stocks at foundries.

Australia	[r] 242,877	277,055	240,821
New Zealand	([13])	--	--
Papua New Guinea[3]	[r] 201,610	202,940	190,128
Total	[r] 7,844,901	8,063,457	7,678,948

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Data shown represent copper content (recoverable where indicated) of ore mined wherever possible. If such data are not available, the nonduplicative total copper content of ores, concentrates, matte, metal and/or other copper-bearing products measured at the least stage of processing for which data are available has been used.

[2] Recoverable.

[3] Copper content of concentrate produced.

[4] Corporación Minera de Bolivia (COMIBOL) production plus exports by medium and small mines.

[5] Smelter production.

[6] Includes copper content of cupriferous pyrites.

[7] Excludes an unreported quantity of copper in iron pyrites which may not be recovered.

[8] Year ending September 30 of that stated.

[9] Data are compiled from operating company reports of Tsumeb Corp. Ltd., General Mining and Finance Corp. Ltd. for Klein Aub Koper Maatskappy Ltd.'s mine near Rehoboth, and Falconbridge Nickel Mines Ltd. for Oamites Mining Company (Pty.) Ltd., Oamites mine. Data for General Mining and Finance Corp. Ltd. are for fiscal years ending June 30 of that stated, while data from other companies are for calendar years.

[10] Copper content of matte produced.

[11] Year beginning March 21 of that stated.

[12] Copper content of run-of-mine production was as follows in short tons: 1973—[r] 103,874; 1974—90,985; 1975—93,952.

[13] Revised to zero.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Unless otherwise noted, data presented for each country represent primary copper metal output, whether produced by thermal or electrowinning. To the extent possible, refined copper produced from imported blister or electrolytic anode copper has been excluded.

[2] Copper content of impure bars and electrolytic copper.

[3] Smelter output of domestic and foreign ores, exclusive of that from scrap. Production from domestic ores only was as follows in short tons: 1973—1,705,065; 1974—1,532,066; 1975—1,374,324.

[4] Figures presented are total blister and equivalent copper output including that blister subsequently refined in Chile and copper which is produced by electrowinning. Material produced for refining at Ventanas smelter is included.

[5] Belgium reports a large output of refined copper, but this is produced mainly from imported blister; domestic smelter production is reported output of blister copper from ores.

[6] Reported Norwegian copper output is derived in part from copper-nickel matte imported from Canada, and reported Canadian smelter production may also include this material. Norwegian smelter output from domestic ores was as follows (approximately) in short tons: 1973—7,500; 1974—6,500; 1975—7,500.

[7] Refined output.

[8] Year ending September 30 of that stated.

[9] Data from Tsumeb Corp., Ltd.

[10] Data include refined copper plus exported blister and leach cathodes.

[11] Includes secondary.

Diatomite

By Arthur C. Meisinger [1]

U.S. production of processed diatomite in 1975 declined 14% in quantity and 10% in value compared with that of 1974. The weighted average price per ton, however, increased from $76.31 in 1974 to $80.01 in 1975, to offset increased costs of energy consumption in the industry's processing plants. Exports of processed diatomite also decreased 21% in quantity and 13% in value, but imports showed a slight increase in 1975.

DOMESTIC PRODUCTION

Domestic production of processed diatomite in 1975 was 572,582 tons, or about 14% below the 1974 figure. However, value of diatomite sales in 1975 increased by approximately $3.70 per ton over that of 1974, primarily owing to continued increases in fuel costs at diatomite processing plants.

During the year, 11 companies operated 15 mine and plant facilities (one less than in 1974, revised) to produce diatomite in 5 States—California, Kansas, Nevada, Oregon, and Washington. Domestic producers in 1975 were: Johns-Manville Sales Corp., with operations at Lompoc, Calif.; Grefco, Inc., Lompoc, Calif. and Mina, Nev.; Excel-Minerals Co., Taft, Calif.; Airox Earth Resources, Inc., Santa Maria, Calif.; NL Industries, Inc., near Wallace, Kans.; Eagle-Picher Industries, Inc., with facilities at Sparks and Lovelock, Nev.; Cyprus Mines Corp., Fernley, Nev.; A. M. Matlock and American Fossil, Inc., both with operations in Christmas Valley, Oreg.; and Witco Chemical Corp. Inorganic Specialties Division, at Quincy, Wash.

Table 1.—Diatomite sold or used by producers in the United States

	1971	1972	1973	1974	1975
Domestic production (sales) ___ short tons __	535,318	576,089	608,906	664,303	572,582
Average value per ton ______________________	$64.25	$65.19	$59.26	$76.31	$80.01

CONSUMPTION AND USES

Compared with 1974, all reported end uses of diatomite showed declines in quantities consumed with the exception of abrasives and lightweight aggregates. Filtration, which continued to be the major end use, accounted for 60% of domestic demand in 1975. Fillers were the second most important end use followed by lightweight aggregates, coating agents, and insulation. Other uses included abrasives, absorbents, inert carriers, paint additives, pozzolan, and silicate admixtures.

Insulation	3	4	4	5	4
Miscellaneous	38	38	35	35	36

W Withheld to avoid disclosing individual company confidential data; included with "Miscellaneous."

PRICES

The weighted average price per ton of processed diatomite sold by producers was $80.01 in 1975 compared with $76.31 in 1974. Price increases were substantial for all major end use categories in 1975 (table 3), with the exception of miscellaneous uses of diatomite, which showed a decrease of $0.62 per ton from that reported in 1974.

Table 3.—Average annual value per ton of diatomite, by use

Use	1974	1975
Filtration	$87.40	$91.73
Insulation	55.59	62.61
Abrasives	129.51	145.56
Fillers	77.12	79.66
Lightweight aggregate	47.31	52.69
Miscellaneous	46.25	45.63
Weighted average	76.31	80.01

FOREIGN TRADE

Exports of prepared diatomite decreased 21% in quantity and 13% in value from that of 1974, and the quantity exported (147,000 tons) represented 26% of domestic production (573,000 tons) in 1975. Principal countries of destination were Canada, 42,715 tons; the United Kingdom, 14,431 tons; Japan, 10,714 tons; West Germany, 10,333 tons; and Australia, 8,293 tons. The average value of exports was $104.18 per ton compared with $94.31 in 1974. Imports of diatomite in 1975 totaled 3,833 tons, nearly all from Mexico (99%).

Feldspar, Nepheline Syenite and Aplite

By J. Robert Wells [1]

Activity in the feldspar industry was at a comparatively low level in 1975, with both production and consumption significantly below the figures recorded in 1974. Although utilization of the mineral in making container glass held up well during the year, the general trend was downward, largely because the slack in housing construction slowed sales of window glass and some ceramics—floor and wall tile, and electrical and sanitary porcelains—weakening demand for feldspar in those applications. Even in the face of lagging demand, feldspar prices rose sharply during the year, yielding to the upward pressure of rising production costs—notably greater outlays for fuels, equipment, and supplies reinforced by the increasing expense of complying with environmental regulations.

Legislation and Government Programs.—According to provisions of the Tax Reform Act of 1969, which continued in force throughout 1975, the depletion rate allowed on feldspar production (both domestic and foreign operations) was 14%.

FELDSPAR

DOMESTIC PRODUCTION

Unground Feldspar.—The 1975 domestic output of feldspar ready to be put into final form for use (that is, the total quantity of hand-cobbed feldspar, flotation-concentrate feldspar, and feldspar content of feldspar-silica mixtures) was 12% less in tonnage than in 1974 but 3% higher in total value. Feldspar was mined in eight States with North Carolina in the lead, followed in descending order by Connecticut, California, Georgia, South Dakota, Arizona, Wyoming, and Colorado. The combined outputs of the first four States named amounted to 97% of the U.S. total. It should be noted that in 1975 the production of hand-cobbed feldspar sank to the lowest level in the 20 years for which comparable data have been recorded.

Ground Feldspar.—Most of the feldspar used in glassmaking is ground no finer than 20 mesh, and substantial tonnages of feldspathic sands (feldspar-silica mixtures) enter into glass furnace feeds with no further reduction in particle size; feldspar to be used in ceramics and filler applications is usually pulverized to minus 200 mesh or finer. In 1975, 8 U.S. companies operated 10 plants in 7 States to grind feldspar for shipment to destinations in at least 21 States, Puerto Rico, Canada, and Mexico. The Oxford Feldspar Corp. mill at West Paris, Maine, was activated in 1975 to produce dry-ground feldspar for ceramic purposes, an event that may possibly foreshadow resumption of feldspar mining in that State (inactive since 1970) or in New Hampshire (inactive since 1969).

[2] Data may not add to totals shown because of independent rounding.

CONSUMPTION AND USES

Unground Feldspar.—In 1975 there was as usual no significant consumption of feldspar in the raw, unprocessed state in which it is taken from the mine. The majority of users acquired their supplies already ground and sized either by the primary producers or by merchant grinders, although some manufacturers of pottery, soaps, and enamels continued their customary practice of purchasing crude feldspar for grinding to their preferred specifications in their own mills. The Bureau of Mines canvass of producers and merchant grinders does not provide information concerning the end use distribution of the material handled in this way. It should be noted that a substantial portion of the material classified as feldspar-silica mixtures serves in glassmaking without additional processing, so that this utilization might properly be considered as consumption of unground feldspar.

Ground Feldspar.—The 1975 end use distribution of ground feldspar in the United States indicated that 51% of the total was consumed in glassmaking and 39% was used in pottery. The remaining 10% was used in a diversity of applications, including glazes, enamels, soaps, abrasives, sanitary ware, rubber products, and electrical insulators.

[3] Data do not add to total shown because of independent rounding.

STOCKS

From a comparison of 1975 data on domestic production and sales of feldspar, it was estimated that U.S. producers had 239,000 tons of feldspar (unground, ground, or in process) on hand on December 31, 1975.

PRICES

Engineering and Mining Journal, December 1975, listed the following prices for feldspar, per short ton, f.o.b. mine or mill, carload lots, bulk, depending on grade (prices were generally about $2.50 per ton higher than the corresponding quotations of the preceding year):

North Carolina:	
20 mesh, flotation	$17.50
40 mesh, flotation	$18.00– 27.25
200 mesh, flotation	27.25– 34.00
Georgia:	
40 mesh, granular	26.00
200 mesh	33.00
Connecticut:	
20 mesh, granular	20.00– 22.50
200 mesh	28.00– 30.00

Feldspar prices were quoted by Industrial Minerals (London), December 1975, as follows (converted from pounds sterling per long ton to dollars per short ton):

Ceramic grade, powder, 200 mesh, bagged, ex-store	$59–$66
Sand, 2–3 mm, ceramic and/or glass grade, c.i.f. main European port	41– 51

No explanation was offered for the fact that the ceramic-grade quotations were about 25% lower than their respective 1974 counterparts, while those for ceramic and/or glass material were 30% higher.

FOREIGN TRADE

In 1975, U.S. exports classified as feldspar, leucite, and nepheline syenite (but presumably all or mostly feldspar) amounted to 9,543 tons valued at $506,834, approximately half the comparable figure reported in 1974. Chief recipients of the exported material were Canada, 72%; Mexico, 22%; and Taiwan, 3%. The remaining 3% was shared among nine other countries.

U.S. imports for consumption of feldspar in 1975, although notably higher than in 1974, still amounted to only a small fraction of the quantity exported (3% of the tonnage, 5% of the total value). In addition to feldspar and nepheline syenite, U.S. imports in 1975 included 1,371 tons of material, probably feldspathic in nature, that was classified as "Natural mineral fluxes, crude, crushed, ground, or pulverized" with a total value of $229,786.

The tariff schedule in force throughout 1975 provided for a 3½% ad valorem duty on ground feldspar; imports of unground feldspar were admitted duty-free.

Table 4.—U.S. imports for consumption of feldspar

Country	1974		1975	
	Quantity (short tons)	Value	Quantity (short tons)	Value
Crude:				
Canada	30	$617	--	--
South Africa, Republic of	--	--	[1]209	$17,188
Total	30	617	209	17,188

WORLD REVIEW

Finland.—The name of Finland's only feldspar producer, which operates a flotation process on Kimito Island, was changed in October 1975 from Lohjan Kalkkitehdas Oy (or Lojo Kalkverk AB) to Oy Lohja AB Minerals. An expansion was begun to increase the company's production capacity from the current 75,000 tons per year to 83,000 tons per year, of which it is estimated that about 75% will be exported to the United Kingdom, other European countries, and the Far East.

France.—In July 1975, Denain Anzin Minéraux (DAM) took over controlling interests in two other firms, Société Sipo and Société des Feldspaths du Midi, thus becoming the largest feldspar producer in the nation. DAM's current production consists of about 11,000 tons per year of glass-grade soda spar and 7,000 tons per year of potash spar for use in enamels and electrical porcelain.

Germany, West.—The combined outputs of some 15 large firms distributed throughout the country place West Germany unchallenged at the head of Europe's feldspar-producing nations. Even so, consumption still outruns production, and 1974 imports included 66,000 tons of feldspar from Scandinavia, Finland, Italy, France, and the Republic of South Africa.

Guatemala.—Cia. Vidrios, Soc. Anon. (CAVISA) extracted 33,000 tons of feldspar in 1974 for use in its own factory, the only glassmaking facility in the country, and in mid-1975 inaugurated a new and larger plant with a rated capacity of 40,000 tons of feldspar per year.

India.—The joint output of six large firms (Bharat Mineral Supply Corp., Golecha Palwat & Co., G. L. Kala, R. D. Maniar & Co., Shetty & Co., and Syed Altaf Hussain), all operating in the northwestern State of Rajasthan, amounted to approximately 70% of India's total 1975 feldspar production.

Italy.—Nearly three-quarters of Italy's total 1975 feldspar output came from quarries operated by C. Maffel & Co. at Pinzolo, Trento Province, near the southern border of the Dolomite Alps. Crude material from those sources was processed in the company's three mills (a primary crushing plant near the mine site, and grinding mills at Darzo and Trento) for use in ceramics, paint, and glass.

Norway.—Detailed discussions of Norway's feldspar and nepheline syenite industries were featured in a journal article.[2]

Sweden.—The only feldspar producer in Sweden, AB Forshammars Bergverk (subsidiary of Luossavaara Kiirunavaara AB, a Government-owned producer of iron ore) mines the Limberget pegmatite deposit in Orebro Province, about 25 miles north of Köping. It was announced that the ore body has been estimated to contain at least 0.7 million tons (already exposed) and 4 million tons (proved by drilling) of the type of material currently being exploited.[3]

---

[2] Industrial Minerals (London). Scandinavia: Norway's Industrial Minerals. No. 88, January 1975, pp. 19–41.

Thailand.—It was reported that the Thai Mining Industry Co. of Bangkok (70% Thai-controlled, 30% British) will invest the equivalent of $1 million in a venture aimed at producing 44,000 tons per year of industrial minerals, including feldspar, within the national borders, thereby providing employment for about 125 additional mine workers and at the same time effecting a drastic reduction of the sums currently being spent to obtain those minerals from foreign sources.

United Kingdom.—Goonvean & Rostowrack China Clay Co., Ltd., has been the only remaining supplier of Cornish Stone (or China Stone) since 1973 when English Clays Lovering Pochin Co., Ltd., ceased producing that widely used feldspathic material. Recently Goonvean & Rostowrack reported that, despite ample reserves, their production of Cornish Stone has been hard put to keep abreast of expanding demand, largely because of difficulty in maintaining a sufficient force of specially trained workers for the exacting hand-selection process involved.[4]

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, the People's Republic of China, Czechoslovakia, Romania, and the Territory of South-West Africa produce feldspar, but available information is inadequate to make reliable estimates of output levels.

[2] Described in source as lump feldspar; does not include nepheline syenite as follows in short tons: 1973—220,793; 1974—224,430; 1975—345,266.

[3] Includes pegmatite.

[4] Chiefly labradorite.

[5] In addition, the following quantities of aplite were produced in short tons: 1973—[r] 546,750; 1974—539,670; 1975—357,056.

TECHNOLOGY

Feldspar containing more than a minimal trace of iron is unsuitable for use in the manufacture of such specialized ceramics as porcelain insulators, hospital stoneware, and sanitary ware, but in most commercial deposits a large part of the feldspar occurs in intimate association with detrimental amounts of mica and garnet, both of which are iron-bearing minerals. Although these minerals are only weakly magnetic, it was found that high-intensity wet magnetic separation provided an adequate means of eliminating them from the ore stream, thus converting an otherwise troublesome waste material into a salable product.[5]

Bureau of Mines research in 1975 included a continuing study of the feasibility of producing feldspar and glass-sand concentrates by processing granite from various sources. It was reported that in three of four head samples from New Hampshire, it was difficult to effect liberation of the feldspar from accompanying iron minerals without grinding to a fineness beyond the limit imposed by glassmaking specifications. In related work, preliminary mineralogical and beneficiation studies were started on samples of a mixture of feldspar, quartz, biotite, and clay that constitutes the overburden at a granite quarrying operation in Georgia.

Another sector of Bureau of Mines research was directed toward finding environmentally attractive and economically advantageous outlets for waste glass, especially the material that could be made available by the systematic collection of discarded single-use beverage bottles. A report was issued presenting results obtained in one phase of this investigation.[6]

Computer control of the flow of the glassmaking materials, including feldspar and cullet (recycled glass), is a salient feature of the ultramodern batch house recently placed in service at the TV-tube plant of Owens-Illinois, Inc., in Columbus, Ohio. Details of this innovative facility, which incorporates a system for the electrostatic precipitation and collection of even the most finely divided solids from the furnace effluent and their return to the batch, were described in a journal article.[7]

In a study made in the Netherlands it was concluded that, according to time criteria, it is possible by proper choice of refining agents to achieve satisfactory melting performance with a soda-lime glass batch incorporating sand and potassium feldspar in particle-size ranges below 100 mesh.[8]

NEPHELINE SYENITE

Nepheline syenite is a light-colored rock that, although resembling medium-grained granite in texture, contains a significantly smaller proportion of quartz and consists principally of nepheline and alkali feldspars, usually in association with minor amounts of other minerals. Large quantities of nepheline syenite (after processing to remove objectionable substances, especially iron-bearing minerals) are consumed in making glass and ceramics. There is no domestic production of nepheline syenite in grades suitable for these purposes, however, and U.S. needs are wholly supplied by imports.

Customarily, U.S. consumption of feldspathic materials consists of roughly two-thirds feldspar plus aplite and one-third nepheline syenite from Canada, where Indusmin, Ltd., and Sobin Chemicals (Canada), Ltd., are the only two producers. In 1974, the last year for which an estimate is available, Canadian production totaled approximately 607,000 tons with a value of $8.5 million, increases from 1973 of 5% in tonnage and 15% in value, but the quantity exported to the United States in 1975 was sharply down from the corresponding figure for 1974, the first decrease recorded since 1961.

Other than Canada, only two countries are known to produce significant quantities of nepheline syenite—Norway with 221,000 tons in 1973 and 224,000 tons in 1974, and the U.S.S.R. where, although production figures are not published, the material is reportedly used in glass and ceramics and also as a source of alumina for electrolytic aluminum plants.

[7] Svec, J. J. New Batch Plant at O-I is Fully Automatic. Ceram. Ind., v. 105, No. 5, November 1975, pp. 12–14.

[8] Houben, M. M. H., H. W. Morelissen, and J. Cornelissen. Influence of Grain Size of Sand and Potassium Feldspar in Combination With Refining Agents on the Melting Properties of Soda-Lime Glass Batch. Pres. at 77th Ann. Meeting, Am. Ceram. Soc., Washington, D.C. May 3–8, 1975, Paper 38–G–75; abs. in Am. Ceram. Soc. Bull., v. 54, No. 4, April 1975, p. 432.

The price range quoted for imported nepheline syenite in Ceramic Industry Magazine, January 1976, was from $13.00 to $31.45 per ton, depending upon grade, purity, grind, packaging, transportation, quantity sold, and other factors. Industrial Minerals (London), December 1975, quoted price ranges for Norwegian nepheline syenite, c.i.f. main European port, as follows:

Glass grade, 32 mesh (Tyler), bulk, per short ton	$36–$41
Ceramic grade, 325 mesh (Tyler), bagged, per short ton	54– 60

Prices for Canadian material were listed as "nominal."

The June 7, 1976, issue of American Paint & Coatings Journal quoted paint-grade nepheline syenite in 50-pound bags, carload lots, f.o.b. Ontario, at $34.35 to $47.85 per ton.

Table 6.—U.S. imports for consumption of nepheline syenite

Year	Crude		Ground	
	Quantity (short tons)	Value (thousands)	Quantity (short tons)	Value (thousands)
1973	258	$4	473,838	$6,022
1974	4,605	79	505,028	7,558
1975	6,275	98	424,838	6,869

APLITE

Aplite is an aluminous silicate mineral material of granitic texture containing quartz mixed with varying proportions of soda or lime-soda feldspar; it is usually not suitable for use in ceramics but, if sufficiently low in iron, finds ready acceptance in the manufacture of glass, especially container glass. Japan, with about one-half million tons per year, is the world's foremost producer of aplite.

Aplite of glassmaking quality was produced in the United States in 1975 only from two open pit operations in central Virginia. The Feldspar Corp. mined aplite near Montpelier, Hanover County, and treated the material by wet grinding, classification, and gravity separation, followed by dewatering, drying, and high-intensity magnetic separation to eliminate iron minerals. Sobin Chemicals, Inc., an affiliate of International Minerals and Chemical Corp., operated an aplite mine near Piney River, Nelson County, and removed iron from the dry-ground ore by a high-intensity magnetic process.

Total U.S. production of aplite, which has been estimated at about 210,000 tons per year,[9] declined moderately in 1975.

Aplite prices are not commonly quoted in trade journals, but the product traditionally commands a somewhat lower per-ton price than feldspar. Prices of $15.25 per ton for low-iron material, f.o.b. producing point, and ranging downward to $11.50 per ton for grades higher in iron, were mentioned as current.[10]

Ferroalloys

By Thomas S. Jones [1]

Production and consumption of ferroalloys decreased with few exceptions in the United States in 1975 compared with 1974. Production, totaling less than 2 million tons, was the least since 1962, with several producers reporting operating rates of less than 50% of capacity. Consumption of most ferroalloys was at 70% to 80% of 1974 levels, paralleling decreases in business activity at steelplants and iron foundries, the major users of ferroalloys. Production and consumption of chromium alloys and consumption of ferronickel all fell to about half of 1974 amounts, in line with a similar decline in production of stainless steel. Ferromanganese production increased 6% upon reactivation of a blast furnace. The general climate that prevailed in the U.S. ferroalloy industry was experienced in foreign countries as well because of worldwide slackening of steel production.

In the United States, investment in new ferroalloy facilities was concentrated almost entirely in ferrosilicon plants. Increases in productive capacity scheduled by 1977 were expected to add over 200,000 annual tons. Additional significant new capacity for ferrosilicon was being added in Canada, as were new facilities for chromium alloys in Africa and for manganese alloys in Mexico, Brazil, and West Europe. U.S. steel producers showed increasing interest in participating in ferroalloy ventures, both domestic and foreign.

U.S. trade in ferroalloys was again strongly in deficit. The deficit in chromium alloys more than doubled, as did the amount of imported high-carbon ferrochromium. However, the deficit in silicon alloys dropped as imports decreased and exports increased, both substantially. Producers' and consumers' stocks increased for all major ferroalloys except that consumers' stocks of silicon alloys declined. Stock building was especially pronounced for chromium alloys. Price changes for domestic material were relatively insignificant. Increases and decreases both occurred by amounts generally much smaller than in 1974.

Technical developments in agglomeration and steelmaking, as well as political happenings in Africa, promised to accelerate the use of ferrochromium produced from South African ores. The consequence will be a shift of traditional preferences from alloys high in chromium to those of lower chromium content.

Detailed information concerning production, trade, and use of specific alloys can be found in the respective chapters on chromium, manganese, molybdenum, nickel, silicon, tungsten, and vanadium.

Legislation and Government Programs.—The U.S. Environmental Protection Agency (EPA) released a study done by Batelle Columbus Laboratories on product flexibility of ferroalloy furnaces. The agency found that sealed furnaces have the lowest air pollution potential, but very few furnaces in the United States are of this type. The study concluded that sealed furnaces have lower product flexibility than open furnaces and are particularly difficult to use for making high-silicon materials. A near-term shift by U.S. producers to sealed furnaces was judged unlikely.[2]

On February 24, EPA issued interim final water pollution regulations affecting producers of manganese and chromium. By July 1977 the average manganese effluent from an existing electrolytic manganese plant was not to exceed 1.356 pounds per thousand pounds of product, and chromium in effluent from an electrolytic chromium plant was not to average over 0.053. By July 1983 these amounts of effluent were to be reduced to 0.339 and 0.027, respectively. It was proposed that even tighter standards of 0.148 and 0.008, respectively, be adopted for new plants.[3]

Ferrocolumbium (contained columbium)	0.5	--	0.5
Ferromanganese:			
High-carbon	30	578	607
Medium-carbon	29	--	29
Ferromolybdenum (contained molybdenum)	.1	--	.1
Ferrotungsten (contained tungsten)	1	--	1
Silicomanganese	24	--	24

[1] Data may not add to totals shown because of independent rounding.

DOMESTIC PRODUCTION

Production and shipments of ferroalloys fell below the 2-million-ton level for the first time since 1962. Compared with 1974, production was off 16% and shipments were down by 25%. Producer operating rates of 50% of capacity were not unusual, with one firm reporting production at 30% of capacity for much of the year. The strongest showing relative to a year ago was in ferromanganese; production increased 6% as the United States Steel Corp. resumed blast furnace production of the alloy at its National Works in McKeesport, Pa. Ferroalloy categories showing the least production decreases were ferrophosphorus and "Other." In the "Other" category, outputs of ferronickel and spiegeleisen were essentially unchanged from 1974. Strength in production and shipments of these materials and of ferromanganese kept the overall decline in value of shipments to 3%. Production of chromium alloys, especially affected by the drop in stainless steel production, fell by nearly one-half. Union Carbide Corp. consolidated its Ferroalloys Div. and its Mining and Metals Div. into a single, new Metals Div. in the first half of the year.

Investment in new domestic facilities for producing tonnage ferroalloys was small except for silicon alloys. The Airco Alloys Division of Airco, Inc. (Airco) undertook rehabilitation of an existing 25 megavolt-ampere (MVA) ferrochromium-silicon furnace at Niagara Falls, N.Y. Allegheny Ludlum Steel Corp., a division of Allegheny Ludlum Industries, Inc. and a large consumer of chromium alloys, began looking for major sources of supply other than those originating in Southern Rhodesia. Allegheny Ludlum took a minority interest in a new ferrochromium plant to be built in the Republic of South Africa by Johannesburg Consolidated Investment Co. Ltd. (JCI). Late in the year, Satralloy, Inc. switched a ferrochromium furnace to production of high-carbon ferromanganese at its Steubenville, Ohio plant. This move from ferrochromium to ferromanganese foreshadows a similar switch by Union Carbide at its Marietta, Ohio plant, once a joint venture for charge chromium in South Africa begins producing by 1977. When new facilities become fully operational in 1976, the Chemetals Division of Diamond Shamrock Corp. reportedly will double its capacity for "massive manganese" to 17,000 annual tons at Kingwood, W. Va.

Domestic ferrosilicon capacity was scheduled to increase substantially by 1977, by over 200,000 annual tons, 50% basis. In addition to a first full year of production from a computer-controlled 60 megawatt (MW) furnace at Union Carbide's Ashtabula, Ohio plant, future capacity was augmented by the yearend energizing of two new ferrosilicon furnaces. Foote Mineral Company started a 24 MW unit at its Graham, W. Va. plant, and Ohio Ferro-Alloys Corp. began bringing a 46 MVA furnace into production at its Philo, Ohio plant. Airco proceeded with installation at Niagara Falls of a 24 MW furnace which was to become operational in late 1976. By mid-1977 a 40 MW unit with a ferrosilicon capacity of 72,000 annual tons, 50% basis, was to start producing under the management of Tennessee Alloys Corp., a division of International Minerals & Chemical Corp. (IMC). This furnace is a joint venture between IMC and Allegheny Ludlum, and is to eventually replace present smelting facilities at Bridgeport, Ala.

---

[3] Federal Register. Ferroalloys Manufacturing Point Source Category. V. 40, No. 37, Feb. 24, 1975, pp. 8030–8041.

In specialty ferroalloys, Duval Sierrita Corp. began production of ferromolybdenum in the first part of 1975. Duval's new plant near Tucson, Ariz. has an annual capacity of 3.5 million pounds of 60% to 64% ferromolybdenum, made by batchwise silicothermic reduction of roasted molybdenite concentrate. The Pesses Co. announced plans for producing a similar quantity of such heavy metal ferroalloys as ferromolybdenum beginning in 1976 in a plant being constructed at Pulaski, Pa. Purchased raw materials are to be processed into a variety of ferroalloys at the rate of 5 tons per day, initially using aluminothermic methods.

---

[1] FeMn, ferromanganese including spiegeleisen and manganese metal; SiMn, silicomanganese; FeMn, ferromanganese; FeMo, ferromolybdenum; FeNi, ferronickel; FeP, ferrophosphorus; FeSi, ferrosilicon; FeTi, ferrotitanium; FeV, ferrovanadium; FeW, ferrotungsten; Si, silicon metal; SiMn, silicomanganese; Spln, spiegeleisen.

[2] Includes specialty silicon alloys, zirconium alloys, and miscellaneous ferroalloys.

CONSUMPTION AND USES

As a result of production decreases of about 20% compared with 1974 in both the steel and iron castings industries, consumption of almost all ferroalloys declined in 1975. Ferrous applications, predominantly by steelplants, accounted for 80% to 90% of reported consumption for nearly all groups of ferroalloys. Among major ferroalloys, consumption of silicomanganese declined the least in the ferrous end use categories other than stainless steel, indicating that some steelplants and foundries preferred using silicomanganese rather than a combination of ferromanganese and ferrosilicon. Pronounced consumption decreases occurred for ferrochromium and ferronickel, as stainless steel production fell to about half that of 1974.

In specialty ferroalloys, demand for columbium, vanadium, and titanium alloys was aided by continued growth in production of high-strength low-alloy steels. Use of ferroboron in steel strongly increased, and greater amounts of ferrovanadium and ferronickel were used by iron foundries. Ferrotungsten usage was down substantially, at least partly because tungsten carbide is increasingly being favored for making cutting materials. Reported consumption for ferrophosphorus does not include the substantial amount consumed as feed material for vanadium production. A growing market for ferrophosphorus was as an extender in zinc-rich paints.

The format of the accompanying consumption tables has been rearranged to conform with the method of presentation used in the individual commodity chapters. Categories of data tabulated are the same as in prior years.

STOCKS

Producers' stocks of chromium, manganese, and silicon alloys all rose substantially with those of chromium and silicon alloys regaining 1970–72 levels. Stocks of chromium alloys more than tripled; stock rebuilding for manganese alloys corresponded to an inventory increase of about 60% and for silicon alloys more than twice that amount. Consumers' stocks of manganese and chromium alloys advanced further to new record levels. Stocks of silicon alloys decreased by about one-half, as stocks of 75% and 50% grades declined nearly steadily throughout the year.

Table 7.—Stocks of ferroalloys held by producers and consumers in the United States at yearend

r Revised. W Withheld to avoid disclosing individual company confidential data.

[1] Includes ferromanganese, silicomanganese, and manganese metal for 1975; includes spiegeleisen also for 1974.

[2] Includes ferrosilicon, silvery iron, silicon metal, and miscellaneous silicon alloys.

[3] Includes other chromium ferroalloys and chromium metal.

[4] Includes other titanium materials.

[5] Includes other phosphorus materials.

[6] Includes calcium molybdate.

PRICES

Little activity occurred in producers' list prices for ferroalloys. For the most part, poor market conditions offset cost pressures such as those from rising rates for electrical power. Although U.S. producers mostly adhered to listed prices, competition for sales below listed prices was reported, especially in chromium alloys. Discounts were more common for imported alloys, which in some cases began the year selling at a premium but ended below domestic prices. Producer prices decreased by less than 10% for some manganese, silicon, and tungsten alloys, whereas prices increased in September by about the same magnitude for ferromolybdenum and ferronickel. In October, the spot low-alloy ferrocolumbium price rose to about 20% greater than that 12 months previous. Ferrovanadium prices did not change in 1975. Representative producer prices are given in the following tabulation:

Alloy	Price in 1975[1]	
	Beginning	Yearend
Charge chromium (66% to 70%)	$0.48 –$0.57	$0.50
Low-carbon ferrochromium, 0.05% maximum carbon	.88 – 1.20	.92 –$1.20
Standard 78% ferromanganese, dollars per long ton of alloy	440	440
Low-carbon ferromanganese, 0.1% maximum carbon	.595	.545
Ferromolybdenum, powder	3.19	3.60
Ferronickel	1.97	2.16
Ferrosilicon, 50%	.335	.328
Ferrosilicon, 75%	.385	.365

[1] Per pound contained, except as noted otherwise.

Source: Metals Week.

FOREIGN TRADE

The United States was again a net importer of all major kinds of ferroalloys. Compared with 1974, the value deficit increased by about one-third to over $400 million, whereas the volume deficit dropped slightly to about 800,000 tons. The deficit in chromium alloys more than doubled in value while that for silicon alloys decreased by over one-half in both value and volume.

Although exports of ferroalloys were more than twice those in 1974, value increased only 56% because average unit value decreased 25%. Increases in unit value for many ferroalloys were more than offset by decreases in exports of high value ferroalloys and in the unit value for ferrosilicon. Ferrosilicon exports increased sixfold to become the most important ferroalloy export item, amounting to 41% of volume and 27% of value. Ferromanganese exports were about 4.6 times as great as in 1974 at little change in unit value. Canada received more of the chief ferroalloy export categories than any other country, taking over half of total ferroalloy exports and an especially high percentage of ferromanganese. Sweden and West Germany were the next largest recipients overall. Ferroalloys were exported worldwide to over 40 countries.

Value of ferroalloy imports increased one-third over that for 1974, although import volume decreased by 1%. Value rose because of substantial increases in unit value for many ferroalloys, the increases exceeding 85% for chromium alloys and 50% for all grades of ferromanganese. Unit value of 8% to 60% ferrosilicon imports nearly tripled, partly because of a higher proportion of the 50% grade, causing average silicon content in this class to rise from 30% to 40%. The rate of importation was greatest in the first half of 1975.

Volume of ferroalloy imports declined relative to a year ago for practically every category with the major exception of ferrochromium, imports of which were virtually as great as reported consumption. Average chromium content in imported high-carbon ferrochromium dropped an additional 2.5% to 65.2%. Imports of high-carbon ferrochromium more than doubled and were more than twice domestic production. Imports of low-carbon ferrochromium were higher by about one-third and also exceeded domestic production. Early in the year, the Department of the Treasury was petitioned concerning alleged subsidies to the Republic of South Africa ferrochromium producers by their Government. Responsive action was subsequently taken in South Africa, so that by yearend the Department of the Treasury found that no bounties or grants were being paid.

Of the other large-tonnage ferroalloys, imports of high-carbon ferromanganese decreased by only 4% while those of other manganese alloys were about 80% of 1974 amounts. Ferromanganese imports corresponded to about two-thirds of domestic production and somewhat less than half of reported consumption. Imports of silicon alloys were less significant, decreasing from 1974 levels about one-half overall to an amount about 10% that of both production and reported consumption. Ferronickel imports decreased by over one-third, but remained the major source of U.S. supply.

The main group of ferroalloys, consisting of ferrochromium, ferrochromium-silicon, ferromanganese, silicomanganese, and ferrosilicons with 8% to 60% and 60% to 80% silicon, and ferronickel, grew collectively to 98% of volume and 94% of value of imports. Within this group, manganese and chromium alloys accounted for 85% of volume with the balance being about equally divided between ferrosilicon and ferronickel. High-carbon ferromanganese and high-carbon ferrochromium were imported in the largest quantity, together amounting to two-thirds of the total. In descending order, for manganese alloys the main sources were France, the Republic of South Africa, and Japan; for chromium alloys, the Republic of South Africa, Rhodesia, and Japan; and for silicon alloys, Norway, Canada, and Japan. About two-thirds of imported ferronickel was from New Caledonia, with practically all the rest coming from the Dominican Republic. However, value of ferronickel imports was nearly equally divided between the two sources.

Imports were received from 32 countries, about one-third of the total each coming from Western Europe, Africa plus the Middle East, and Asia plus Oceania. Countries in the Western Hemisphere provided 7% of the total. The leading supplying countries were Japan ($125 million and 191,000 tons), the Republic of South Africa ($83 million and 235,000 tons), and France ($54 million and 148,000 tons). The leader in value of shipments to the United States for chromium alloys was Japan, while France led for manganese alloys.

WORLD REVIEW

Statistics on world production of ferroalloys are summarized in table 10. Installations of new facilities from which significant amounts of additional production were expected to be available by 1977 included those for chromium alloys in the Republic of South Africa and Turkey, for manganese alloys in Brazil, Mexico, and Portugal, and for silicon alloys in Canada. Metal Bulletin published another world survey of ferroalloy producers, its previous survey appearing in 1971.[4]

Brazil.—A total of 279,000 tons of ferroalloys was produced, of which the main items were, in thousands of tons, ferrochromium, 58; ferromanganese, 96; silicomanganese, 43; and ferrosilicon, 60. Expansion plans, favored by abundant hydropower and present favorable pollution regulations, suggested a doubling of ferroalloy production by 1980, including alloys produced by the thermite process. Such expansion reportedly would leave Brazil with 40% of capacity available for export, even after satisfying projected strong growth of internal consumption. Ferrochromium led 1975 exports, accounting for about half of a record 63,000 tons.

Manganese.—By shortly into 1976, Eletrosiderurgia Brasileira S.A. (SIBRA) was to bring into operation three new 24-MVA furnaces, two for ferromanganese and one for silicomanganese. These Japanese-designed furnaces are closed, automated, and have pollution controls. SIBRA was reportedly planning installation of two larger furnaces for production in 1978–79.

Silicon.—Expansions adding to ferrosilicon production by 1976–77 were projected by Cia. Brasileira Carbureto de Calcio (CBCC), Cia. Paulista de Ferro-Ligas, Eletrometalur S.A., and Ligas de Alumínio S.A.; CBCC and Eletrometalur were planning to make further capacity increases in 1978–80.

---

[4] Metal Bulletin (London). Ferro-Alloys Survey-1975, ed. by J. H. Parry. 1975, 158 pp.

Canada.—*Manganese.*—Union Carbide Canada Limited lost most of the first half year's production from a 100,000-ton-per-year ferromanganese furnace owing to an extended strike at its Beauharnois plant in Quebec.

Silicon.—Also at Beauharnois, late in the year Chromasco Ltd. started a new 24 MW furnace with capacity to produce 30,000 annual tons of 50% ferrosilicon. SKW Electro-Metallurgy Canada Ltd. (SKW-Canada) began construction at Becancour, Quebec of a new ferrosilicon and silicon metal plant. The plant was scheduled to begin producing about 60,000 annual tons about equally divided between ferrosilicon and metal in 1976.

Greece.—Soc. Minière et Métallurgique de Larymna S.A. (Larco) began implementing an expansion program that would keep Larco as Europe's largest ferronickel producer. Larco's output of 27% ferronickel has been running at 16,000 annual tons of contained nickel. The first stage of expansion at Larymna would increase this by 10,000 annual tons of contained nickel at a cost of $75 million.

Iceland.—Icelandic Alloys Ltd. was formed jointly between the Government of Iceland and Union Carbide Corp. to build a coastal plant near Reykjavik for producing about 50,000 annual tons of 75% ferrosilicon by 1977–78. Total investment capital of about $70 million was to be furnished, 55% by the Government and 45% by Union Carbide.

Japan.—With an overall production of 2,358,000 tons of ferroalloys, Japan's output fell only 6% below its 1974 total and again exceeded that of the United States. Chief items produced were, in thousands of tons; ferrochromium, 536; ferromanganese, 716; silicomanganese, 480; ferrosilicon, 361; and ferronickel, 221. In addition, 8,365 tons of heavy metal ferroalloys were produced. Additions to ferrosilicon capacity included a 40 MVA furnace rated at 30,000 annual tons started by Ube Denki Kaguku late in the year, and a 25 MVA furnace for the 75% alloy to begin operation in 1976 by Kureha Seitetsu Co., a subsidiary of Pacific Metals Co., Ltd. Pacific Metals was also trying to attract joint owners for a new ferronickel smelter in Niigata Prefecture. The project was to begin in 1976 with an initial target of 18,000 annual tons, to be increased ultimately to 44,000 tons.

Korea, Republic of.—The output of three small producers, Inchon Ferro-Alloy Co., Korean Electrometallurgy, and Sam Chok Industries Co. Ltd., was concentrated on ferrosilicon, mostly the 75% grade, and totaled 23,500 tons. Inchon Ferro-Alloy, a joint venture between two Japanese firms and Inchon Iron & Steel Co., the state steel company, started a new 28 MVA ferrosilicon furnace in midyear.

Mexico.—Cia. Minera Autlan S.A. de C.V. was building a $30 million plant for high-carbon ferromanganese with a capacity of 66 MVA at Tamos, Veracruz. Completion of the first and second phases was scheduled for the first half of 1976.

Philippines.—Maria Cristina Chemical Industries started production of ferrosilicon on Mindanao and, with Japanese interests, formed Mindanao Alloy Corp., to be a new producer of ferrosilicon. The new company projected an annual capacity of 30,000 tons by late 1977 from two 25 MVA furnaces. Electro Alloys Corp., owned 40% by Japanese interests and the balance by Philippine Laurel Co., began building a ferrosilicon furnace, also on Mindanao. The furnace was scheduled for completion in 1976 to give a capacity of 12,400 annual tons.

Portugal.—A high-carbon ferromanganese plant rated at 100,000 annual tons was brought into production by Eurominas Electrometalurgica SARL (Eurominas) at Setúbal, a coastal site on the Bay of Setúbal southeast of Lisbon. French interests, including Pechiney Ugine Kuhlmann, own a majority of Eurominas.

South Africa, Republic of.—Total production of ferroalloys amounted to 825,000 tons.

Chromium.—A number of expansion programs have raised fears of overproduction. The expansions, based on lower grade South African ores, are expected to modify longstanding materials preferences in stainless steelmaking. Tubatse Ferrochrome (Pty.) Ltd., a joint venture held 49% by Union Carbide, began construction at Steelpoort of a charge chromium plant rated at 120,000 annual tons. Some production was expected by the end of 1976 and full production in 1977, all for export. A similar size new plant for charge chromium was expected by JCI, also to begin producing in 1977. Allegheny Ludlum Steel took a minority interest in the plant, construction of which was receiving technical assistance from Japan's Showa Denko K.K. Feralloys Ltd. was expanding production facilities at Machadodorp, with completion scheduled for 1977 also.

Manganese.—The expansion program of Feralloys included additional manganese alloy furnaces at Cato Ridge, to begin operating in 1977. Transalloys (Pty.) Ltd. was also planning for 1977 operation a 25 MVA silicomanganese furnace rated at 37,000 annual tons.

Spain.—With a combined 1975 production of nearly 314,000 tons of ferroalloys, Spanish firms were adding capacity for chromium, manganese, and silicon alloys. Ferroaleaciones Españolas S.A., a subsidiary of a firm in which privately-owned Cargill Inc. took a majority interest in 1975, was expanding ferrochromium production 50% to about 30,000 annual tons. Most of the increased output may be domestically consumed by a growing stainless steel industry. Ferroaleaciones y Electrometales was adding fully enclosed 30 MVA silicomanganese and 20 MVA ferromanganese furnaces built by Japan's Tanabe Kakoki at Boo, Santander. At Monzon, Huesca, Hidro Nitro Española S.A. was projecting production in 1976 from a second 45 MVA ferrosilicon furnace rated at 30,000 annual tons, 75% grade.

Turkey.—State-owned Etibank was expanding its processing of ore into ferroalloy with a 50,000-ton-per-year plant for high-carbon ferrochromium near Elazig. Two 17 MVA furnaces built by Japan Metals & Chemicals Co. Ltd. were expected to begin producing in 1976 using hydropower and a feed of about equal amounts of lumpy ore and concentrates.

U.S.S.R.—Negotiations continued with U.S., Japanese, and West European firms on large ferroalloy projects to produce 320,000 tons of ferrochromium and 1.2 million tons of ferromanganese annually. The ferromanganese plant would be part of a manganese complex at Nikopol, near Krivoi Rog in the Ukraine.

Venezuela.—Delays developed in two ferrosilicon projects now expected to ultimately add 100,000 annual tons of production by 1978. As a result, first production was expected in 1976 from a joint project between the Government and Japan's Sumitomo Shoji Kaisha, and in 1977 from the Venbozel project, a joint project between France's Nobel Bozel S.A. and the Venezuelan Corp. of Guyana.

Yugoslavia.—Ferroalloy production totaled 216,000 tons, about two-thirds of which was estimated to be silicon alloys with the remainder about equally divided between high-carbon ferrochromium and ferromanganese. Expansions were slated for ferrosilicon and ferronickel. State-owned Tovarna Dusika Ruse planned a 24 MVA unit for production of 75% ferrosilicon beginning in 1977. Smelter production from the Feni ferronickel project was projected to begin in 1979 and was expected to sustain a level of 16,000 tons of contained nickel over more than a 20-year period.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the countries listed, the People's Republic of China and North Korea are known to produce ferroalloys, but output of these materials are included in estimates for pig iron in the iron and steel chapter, therefore they have been omitted here to avoid duplication. East Germany also is known to produce ferroalloys but it is not clear from source publications whether output has been included together with that of pig iron in the iron and steel chapter. Also Greece, Luxembourg and Southern Rhodesia may produce ferroalloys and output, if any, is also included with pig iron in the iron and steel chapter.

[2] Blast furnace ferroalloys production by Australia, Belgium, Canada, and the United States included under electric furnace output.

[3] Blast furnace ferromanganese, ferrosilicon and spiegeleisen only; other blast furnace ferroalloys are included with pig iron production in the iron and steel chapter.

[4] Includes electric furnace ferroalloys, if any, are produced.

[5] In addition to the countries listed, the United Kingdom and the U.S.S.R. are known to have produced electric furnace ferroalloys and Romania may have produced some electric furnace ferroalloys, but output is not reported and no basis for estimation is available.

[6] Less than ½ unit.

[7] May include small quantities of blast furnace ferroalloys, if any are produced.

[8] Year ended November 30 of year stated.

TECHNOLOGY

The Bureau of Mines continued laboratory study of its process for conserving chromium and nickel through recovery of recyclable alloy pigs from stainless steelmaking dusts. Dusts with additions of coke breeze were pelletized, after which the pellets were dried and then smelted in an inductively heated graphite crucible using a ferrosilicon scavenger to maximize recovery. Resultant pigs contained 10% to 20% chromium, 6% to 12% nickel, about 4.5% carbon, 1% or more silicon, and were essentially free of zinc, lead, and sulfur. Zinc and lead volatilized in the process were recovered as byproduct oxide fume.[5]

---

[5] Powell, H. E., W. M. Dressel, and R. L. Crosby. Converting Stainless Steel Furnace Flue Dusts and Wastes to a Recyclable Alloy. BuMines RI 8039, 1975, 24 pp.

Advances in agglomeration and steelmaking can be expected to enhance use of South African grades of chromite, which contain less chromium and tend to be more friable than those from Rhodesia. In one of several processes being developed for agglomerating fine chromite, waste silica dust from ferroalloy operations is being used as a binder. This application was made by adoption of the "COBO" process at the Trollhättan, Sweden plant of Ferrolegeringar AB, a subsidiary of Metallurg, Inc. In this plant, ground chromite fines with additions of about 3% each of hydrated lime and silica dust were balled and then steam-hardened in autoclaves at 16 atmospheres and 205° C. Operations started in 1975, and by midyear pellets were being produced at the rate of 20 tons per hour, thus making simultaneous use of two types of fines which otherwise detracted from manufacturing economics.[6] Another plant for utilizing chromite fines, in this case through bonding with 3% molasses and 2% to 3% hydrated lime, was scheduled to go into operation in West Germany early in 1976. Mineralhandels Gesellschaft Bouteiller, now owned by Ruhrkohle A.G., projected an output of 40,000 tons per year of 40x40x20 millimeter pellets from a plant located at the Duisburg Harbor, near the Netherlands border. Also, a soft briquetting technique was announced from the Republic of South Africa, to be tested on Transvaal chromite. From a steelmaking standpoint, favorable signs that chromium feed materials produced by agglomeration could be successfully used were given by Japanese producers, who have indicated development of methods for efficiently using ferrochromium containing less than 60% chromium.

Japanese steelmakers also described use of molten ferrochromium in stainless steelmaking at an international ferroalloys conference held in Brazil in June under joint sponsorship of the Instituto Latinoamericano del Fierro y el Acero (ILAFA) and the Associação Brasileira dos Produtores de Ferro-ligas (ABRAFE). The practice described was that of the Nippon Steel Corp. for using desulfurized molten ferrochromium as part of the hot metal charge to an oxygen steelmaking furnace. A double blow was used with the second blow under reduced pressure. This integration of ferroalloy production with steelmaking was claimed to reduce energy requirements, increase efficiency, and lower costs.[7]

In the United States, new ferrophosphorus and rare earth containing ferrosilicon additives were developed. One of these was a briquette composed of a mixture of crushed ferrophosphorus and fertilizer-grade monocalcium phosphate, the phosphate serving both as a binder and, upon dissolution of the briquette in molten steel, as an oxidant of excess silicon in the ferrophosphorus. This briquette was devised to alleviate shortages of low-silicon ferrophosphorus. Commercial use began following successful testing as a ladle additive in open hearth production of free machining steels.[8] A larger variety of rare earth containing ferrosilicons became available, also, and the new forms were being tested in steelplants under production conditions. Techniques of usage and alloy formulation were still under development.[9]

According to a review of air and water pollution control in ferroalloy production, basic control technology has changed little in recent years but the practical experience gained has resulted in refinements. Cost of emission control within the industry has ranged from 4% to 15% of sales. For control of airborne emissions, pressure-type baghouses are being used in the majority of plants as the chief collection device. Utilization of fume has been confined to fumes high in silica or to recycling of silicomanganese furnace fumes when their manganese content is sufficiently great.[10]

Fluorspar

By Richard H. Singleton [1] and John E. Shelton [2]

As the world's largest consumer of fluorspar, the United States continued to rely on imports for about 84% of its reported fluorspar demand in 1975; 76% of these imports came from Mexico, and Spain supplied 12%. Domestic shipments of finished fluorspar decreased 30% from that of 1974 to 140,000 tons; 41% of this was acid-spar. Reported consumption declined 18% because of decreased use in the steel industry and decreased manufacture of hydrofluoric acid (HF) for the chemical industry. Consumers' inventories decreased 26% to 320,000 tons. No sales were made from U.S. Government inventories, which remained at 1.3 million tons. During 1975, U.S. imports of fluorspar, two-thirds as acid-spar, decreased 21% to 1,050,000 tons. Imports of synthetic and natural cryolite increased 4% to 22,000 tons, and imports of 70% HF increased 42% to 46,000 tons.

Price increases ranging from 12% to 25% were reported for various grades of fluorspar. All increases were predominantly the result of inflationary cost increases; there was no shortage throughout the world, and no cartel was known to be controlling prices.

The Trade Act of 1974 authorized the President of the United States to enter into trade agreements with foreign countries, whereby the import duty on fluorspar could be eliminated or reduced 60%. By yearend 1975, no changes in tariff had been noted.

U.S. Borax and Chemical Co. continued evaluation of its fluorspar-barite deposit in the Sweetwater district southwest of Knoxville, Tenn.

Consumption of met-spar by the iron and steel industry remained at 44% of the U.S. total for both 1974 and 1975. Consumption of acid-spar to make HF for the chemical and aluminum industries remained the major use for fluorspar, consuming 54% of the total in both 1974 and 1975.

Concern about the escape of chlorofluorocarbons from aerosol sprays and refrigerants into the atmosphere continued. Demand for fluorine for manufacturing chlorofluorocarbons was down resulting in a reduction in demand for acid-spar.

World production decreased 5% to about 5.09 million tons, approximately 50% of which was acid-spar. Mexico remained the largest producer with 23% of world production followed by the U.S.S.R. The U.S.S.R. remained the second largest consumer, using about 1.0 million tons in 1975. Numerous mine closings in Thailand lowered its world production ranking from third to seventh.

The largest fluorspar importing countries were the United States, the U.S.S.R., Japan, West Germany, and Canada.

r Revised.

[1] Does not include fluosilicic acid and imports of hydrofluoric acid and cryolite.

[2] Apparent consumption includes finished shipments, plus imports, minus exports, and plus or minus consumer inventory adjustments.

Legislation and Government Programs.—The U.S. Office of Preparedness established a stockpile objective of 159,000 tons of met-spar and prepared a plan to dispose of 253,000 tons of excess met-spar and its entire inventory of acid-spar, 890,000 tons. By yearend 1975, Congress had not authorized disposal of these excess materials.

The Trade Act of 1974, which was signed in December, authorized the President under Title 1, for a period of 5 years, to negotiate trade agreements whereby the import duty on acid-grade fluorspar may be eliminated and on metallurgical-grade could be reduced 60%. Under Title 5, Generalized System of Preferences, the President was authorized to suspend the import duty on fluorspar for the most-favored less-developed countries; but after hearings were held, fluorspar was eliminated from the list of eligible minerals under this act.

U.S. fluorspar import duties effective through 1975 were as follows:

Item	Number	Rate of duty		Statutory rate long ton
		Long ton	Short ton	
Acid grade (+97% CaF_2) --	522.21	$2.10	$1.875	$5.60
Metallurgical grade (−97% CaF_2) ----------	522.24	8.40	7.50	8.40

The Government, through the Office of Minerals Exploration, can grant loans up to 50% of approved costs for exploration of eligible deposits of fluorspar, but in 1975 the administrating agency, the U.S. Geological Survey, had no funds for this program.

Fluorspar was subject to a Federal depletion allowance of 22% on domestic production and 14% on foreign production.

The Bureau of Mines Metallurgy Research Center, Albany, Oreg., continued its research on fluorine recovery from phosphate rock. Synthetic fluorspar prepared from recovered fluosilicic acid was being tested in pilot plant basic oxygen furnace operations.

DOMESTIC PRODUCTION

During 1975, domestic shipments of fluorspar decreased 30% to 140,000 tons. About 41% was acid-spar and 59% was met-spar, which included gravel-spar, ceramic-spar and briquets. About 71% of production was in Hardin County, Ill. The rest was shipped from mines in Utah, Texas, Montana, Nevada, Kentucky, and New Mexico, in order of volume.

During 1975, 15 mines and 8 flotation and heavy-media plants operated, but only 4 plants operated full time. Names and locations of these facilities were as follows:

U.S. fluorspar-producing mines[1] and mills in 1975

State	Company	Mines	Plants
Colorado	Ozark-Mahoning Co	Cowdrey[2]	Flotation.
Illinois	Hastie Mining Co	Spar Mountain	None.
Do	Allied Chemical Corp	3 mines	2 flotation.
Do	Ozark-Mahoning Co	4 mines	Flotation. 2 heavy-media.
Do	Tamora Mining Co	1 mine	None.
Kentucky	Cerro Spar Corp	Babb-Barnes	Flotation.
Montana	Roberts Mining Co	Crystal Mountain[2]	Heavy-media.
Nevada	J. Irving Crowell, Jr. & Sons	Daisy	None.
Do	Spor Brothers	Mary	Do.
Texas	D & F Minerals Co	Paisano	Do.
Utah	U.S. Energy Corp	Fluoride Queen	Do.
Do	Willden Fluorspar Co	Lost Sheep	Do.
Do	Spor Brothers	Fluoride[2]	Do.
Total		15	[3]8

[1] Mines having significant output in 1975.
[2] Output from inventory only.
[3] Four operations were full time.

Two mines were closed during the year, one in New Mexico, and the other in Kentucky. In March 1975, the Fluorspar Division of Allied Chemical Corp. purchased and took over control of Minerva Oil Co.'s fluorspar operations in Illinois and Kentucky.

In Kentucky, Cerro Spar Corp. operated the Babb-Barnes mine. This mining operation was a joint venture, which was owned 70% by Cerro Spar Corp., a wholly owned subsidiary of Cerro Corp., and 30% by Frontier Resources Inc., Denver, Colo., and J. Fred Landers, Nashville, Tenn. Also, in Kentucky, Allied Chemical Corp. closed the Lafayette mine and allowed it to flood.

In Texas, mining operations were continued by D & F Minerals Co. in the Christmas Mountains located on the north edge of Big Bend National Park. In Utah, Willden Fluorspar Co., the Spor Brothers, and U.S. Energy Corp. continued small shipments. In Nevada, J. Irving Crowell, Jr. & Sons, and Spor Brothers, near Beatty, Nev., continued shipments, Crowell to a steel company and Spor Brothers to a cement company. Bailey Fluorspar Co. continued to operate its buying stations at Marathon, Tex., and Delta, Utah, where it purchased washed and screened custom ore for the met-spar market.

In Illinois, both Ozark-Mahoning Co. (subsidiary of Pennwalt Corp.) and Allied Chemical Corp. carried on a continuous exploration and development drilling program. By so doing, they have been able to develop sufficient reserves to replace reserves depleted by production. The mines and operating plants of Ozark-Mahoning near Rosiclare, Ill., were closed by a labor dispute from July 1 to September 22.

U.S. Borax and Chemical Co., a subsidiary of Rio Tinto-Zinc Corp., Ltd., continued exploration drilling on its fluorspar-barite prospect in the Sweetwater district, southwest of Knoxville, Tenn. The company has announced major discoveries in McMinn, Monroe, and Loudon Counties that could total 50 million tons of fluorspar ore assaying 15% to 30% CaF_2. Allied Chemical Corp. completed drilling projects on the Brown's Canyon Claims near Salida, Colo., and abandoned all exploration activity in New Mexico.

Seven fluorspar briquetting or pelletizing plants operated during 1975. These plants furnished fluxing material for the iron and steel industry and cannot be classified either as producers or end use consumers of fluorspar; they were beneficiators or convertors of fluorspar ore into a more usable product. The compaction blends, containing fines, gravel, or filter cake, assayed from 35% to 97% CaF_2; additions of lime, limestone, and oxides of manganese, iron, aluminum, titanium, boron, etc., as well as cinders, were made to fulfill customer requirements. The briquetting industry operated at about one-half of capacity during 1975 and produced 224,000 tons of briquets valued at approximately $18 million. Operating data for 1975 were as follows:

	Tons	Average CaF_2 content
Total capacity	460,000	--
Fluorspar processed, all kinds	185,000	84%
Fluorspar briquets produced	224,418	61%
Fluorspar briquets shipped	216,955	61%

Locations of fluorspar briquetting plants operating in 1975 were as follows:

State	City	Company
Illinois	Rosiclare	Ozark-Mahoning Co.
Indiana	East Chicago	National Briquet Corp.
Michigan	Dearborn	Mercier Corp.
Pennsylvania	Duquesne	Cametco, Inc.
Texas	Brownsville	Delhi Foundry Sand Co. Ogleby Norton and Co. Ozark-Mahoning Co.

The fluorspar supply picture is incomplete without including the supply of fluorine derived from byproduct hydrofluosilicic acid (H_2SiF_6), which is recovered from the wet-process production of phosphoric acid. During 1975, 60,500 tons of H_2SiF_6 was recovered at phosphoric acid plants. Theoretically, the 79% fluorine content of this acid is equivalent to about 80,000 tons of acid-spar that would have been used to make HF for the chemical and aluminum industries and for fluoridation of public water supplies. About 67% of the H_2SiF_6 was used to make fluoride salts for the aluminum electroflux potlines, 12% was used for other chemical products, and 21% was used in water fluoridation. The H_2SiF_6 supply is expected to continue to increase slowly as new phosphoric acid plants are built in Florida and North Carolina.

CONSUMPTION AND USES

U.S. consumption as reported by consumers decreased 18% from 1,525,000 tons in 1974 to 1,245,000 tons in 1975; however, apparent consumption indicated a 9% decrease to 1,300,000 tons in 1975. As previously mentioned, the briquetting industry reported processing 185,000 tons of primary fluorspar averaging 84% CaF_2 and shipping about 217,000 tons of briquets averaging 61% CaF_2.

The major consuming industries were iron and steel, 44%; chemical, 40%; and aluminum, 14%. The other 2% was used to make glass, ceramics, enamels, calcium cyanamide, welding rods, cement, uranium tetrafluoride, magnesium metal, and nonferrous metal fluxes. Demand increased in the cement industry and in refining of certain nonferrous metals.

During 1975, the steel industry consumed about 550,000 tons of fluorspar of which 65% was used in basic oxygen furnaces, 16% in open hearth furnaces, 13% in electric furnaces, and the remainder in manufacturing iron and steel castings. Usage ranged from 3 to 11 pounds of fluorspar per ton of steel ingot and averaged about 9 pounds. Fluorspar substitutes that have been tried either require at least 50% more of the substitute material than fluorspar to perform the same fluxing and cleaning actions or contain deleterious elements that limit their use to specialty steels or certain types of furnaces. Substitute materials, such as colemanite, bauxite, ilmenite, olivine, limonite, and red mud or mixtures of them, were being used to start a furnace batch or to mix with fluorspar to make briquets.

During 1975, the U.S. aluminum industry produced 3,879,000 tons of aluminum ingot. At an assumed consumption rate of 55 pounds of fluorine per ton of aluminum, the calculated total industry consumption was 226,000 tons of acid-spar equivalent. This acid-spar was used to make HF, which in turn was used to make aluminum fluoride and sodium aluminum fluoride that were used to form the molten electrolyte in aluminum potlines. A small amount of acid-spar was added directly to aluminum and magnesium reduction cells during operation, as shown in table 4.

H_2SiF_6, recovered as a byproduct from the phosphoric acid industry, was an additional source of fluorine for making aluminum-cell electrolyte. Quantities of H_2SiF_6, equivalent of 49,000 tons of acid-spar, were used by the aluminum industry, thereby decreasing the total acid-spar consumed by the aluminum industry to about 177,000 tons.

During 1975, about 674,000 tons of acid-spar, domestic and foreign, was used to make HF in nine plants in the United States. Most of the plants were located at coastal ports in Texas, Louisiana, New Jersey, and Delaware. All, including the inland plants, were accessible by water routes.[3] In addition, 46,000 tons of HF was imported for consumption.

Inorganic fluorides were manufactured from HF for use as insecticides, preservatives, antiseptics, catalysts, fluxes, in fire extinguishers, and for steel pickling. Elemental fluorine gas, which is derived from HF, was used to manufacture uranium hexafluoride from tetrafluoride to produce sulfur hexafluoride, halogen fluorides, and emulsified perfluorochemicals. Organic fluorides were the volume leaders in the fluorine chemicals industry using over 50% of the HF produced. Organic fluorides were manufactured by reacting anhydrous HF with chloroform or carbon tetrachloride to produce a variety of chlorofluorocarbons. As chemically stable compounds, they performed outstandingly as refrigerants, aerosol propellants, solvents, resins, and elastomers. Chlorofluorocarbons, commonly called fluorocarbons, used as aerosol propellants were the subject of a growing controversy as to whether they affect the ozone layer in the stratosphere. The hypothesis proposes that ultraviolet radiation releases chlorine from the fluorocarbon and the chlorine reduces the density of the ozone layer, which shields the earth from the cancer-forming ultraviolet radiation. This possibility became the subject of a Government-sponsored study.

By early 1975, sales of fluorocarbon aerosols were down, and fluoride orders by chemical manufacturers were held up. The depressed market for fluorocarbons continued through 1975. It was estimated that it may be years before a scientific solution or explanation will be widely accepted and that, in the meantime, up to 15% of the acid-spar market could be affected.

Fluorine consumption in the manufacture of uranium for generating nuclear power had been estimated in 1974 using newly available information. In 1975, acid-spar demand for treatment of 14,500 tons of uranium oxide (U_3O_8) was estimated at 20,000 tons. Approximately 1.25 tons of acid-spar was required per ton of U_3O_8 used to make uranium hexafluoride, UF_6, from which fissionable U_{235} isotope was subsequently separated by gaseous diffusion. Since the gaseous diffusion plants went into operation, UF_6, depleted of most of the U_{235}, has been stockpiled. The U.S. Energy Research and Development Administration (ERDA) has reported that it has in stock about 170,000 tons of UF_6 and about 65,000 tons of UF_4. These materials contain about 70,000 tons of fluorine equivalent to about 152,000 tons of acid-spar. This large stockpile, plus possible decreased fluorine consumption per nuclear-energy unit, beclouds long-range predictions of large future fluorspar demands in fabrication of nuclear fuels.

Other States [1]	28,724
Total	1,244,938

[1] Includes Georgia, Maryland, North Carolina, Delaware, Iowa, Oklahoma, and Washington.

STOCKS

U.S. producers reported a 17% decrease to 11,400 tons of finished fluorspar in inventory. Domestic consumer stocks decreased 26% to 320,000 tons. No sales were made in 1975 by the General Services Administration from government stockpiles, which remained at 1,302,000 tons, as follows:

	Goal	Inventory	Authorized for disposal
Acid grade	--	890,000	890,000
Metallurgical grade	159,000	412,000	253,000
Total	159,000	1,302,000	1,143,000

Inventories in the major producing market-economy countries increased during the year.

PRICES

Domestic fluorspar prices, f.o.b. Illinois, as reported in the Engineering and Mining Journal, increased during the last three quarters of the year. The base price of dry acid-spar increased 11% to $95 per ton, and 70% effective CaF_2 met-spar pellets or briquets increased 19% to $83 per ton. According to the journal, acid-spar imported through Wilmington, Del., was quoted at $102.50 to $125 per ton.

The world price of fluorspar was strongly influenced by Mexican producers because they supplied nearly one-half of the fluorspar sold on the open market. Fluorspar prices at the Rio Grande Mexican border increased about 25%. Prices quoted in the Engineering and Mining Journal for 70% effective CaF_2 met-spar at the border for rail shipment f.o.b. cars rose from $48.50 per ton in December 1974 to $60.50 to $61 at yearend 1975; the price at Tampico, Mex., f.o.b. vessel, rose from $50 in 1974 to $63 during the same period.

FOREIGN TRADE

U.S. imports of fluorspar decreased 21% to 1,050,448 tons equaling 81% of apparent consumption. Mexico continued to supply most of these imports, accounting for 76% of volume in 1975, with European countries supplying most of the remainder. Approximately 67% of U.S. imports were acid-spar, which decreased 17% to 699,400 tons; the balance, mostly met-spar, was imported mainly from Mexico and decreased 29% in volume. An increasing amount of this met-spar was used to make briquets for use as a flux in steel furnaces. A small quantity, approximately 1,400 tons of fluorspar, was exported, primarily to Canada. In addition to fluorspar, 46,000 tons of 70% HF was imported, mainly from Canada, a 42% increase over that of 1974; and 22,000 tons of synthetic and natural cryolite was imported from 12 different countries.

Table 7.—U.S. exports of fluorspar

WORLD REVIEW

World production of fluorspar decreased 5% to about 5.09 million tons, approximately 50% as met-spar. Mexico remained the largest producer with 23% of world production, followed by, in order of volume, the U.S.S.R., Spain, the People's Republic of China, and France. Numerous mine closings in Thailand lowered its world production ranking from third to seventh.

The United States remained the world's largest importer and consumer of fluorspar, importing 1.05 million tons in 1975. The U.S.S.R. was the world's second largest importer and consumer followed by Japan and West Germany.

North American fluorspar production decreased 12% to 1.41 million tons in 1975; inventory accumulation was more than 200,000 tons mainly because of reduced Mexican exports to the United States.

Western European production decreased 4% to 1.40 million tons in 1975 because of depressed market conditions; about 30% of this production was met-spar. Sizable stockpiles were accumulated during the year. The major producers were, in order of volume, Spain, France, Italy, the United Kingdom, and West Germany. Sweden continued to produce about 4,000 tons per year.

Eastern European, including Mongolian, production increased about 8% to an estimated 1.08 million tons, about two-thirds was met-spar.

Asian, excluding Mongolian, fluorspar production decreased 15% to about 723,000 tons because of mine closings in Thailand caused by decreased Japanese demand and Thai political instability. Met-spar comprised approximately 90% of Asian production.

African fluorspar production increased 15% to an estimated 375,000 tons, because of increased output in Kenya and particularly in Morocco; about one-quarter was met-spar.

South American fluorspar production increased 7% to 134,000 tons, about three-quarters of which was met-spar. The increase was due to increased output in Brazil.

Brazil.—As the largest producer in South America, annual Brazilian output of fluorspar concentrate increased in 1975 to 71,700 tons, approximately one-quarter of which was acid-spar. The industry operated at nearly full capacity. About one-third of the total production was exported, mainly as acid-spar. The United States received most of this export although about 6,000 tons went to Japan. The remainder of production was used mainly in the Brazilian steel industry. The ore was generally of high grade and easily minable. It was concentrated by flotation at a number of small plants. Exploration for new deposits continued in 1975 because reserves appeared to be sufficient for only about 10 years.

Canada.—Canada's only fluorspar mines, operated by Alcan's Newfoundland Fluorspar Works, were closed in June by a labor strike. Consequently, Canadian production all heavy-medium concentrate containing 65% CaF_2 fell from 175,000 tons in 1974 to 70,000 tons in 1975. Fluorspar imports, mostly acid-spar, increased 10% to 173,000 tons. More than one-half (54%) of imports continued to come from Mexico. Imports from Spain increased more than tenfold in 1975 to approximately 47,000 tons.

China, People's Republic of.—China continued to export about two-thirds of its substantial production of met-spar, estimated at approximately 385,000 tons in 1975. Imports of Chinese fluorspar by Japan decreased 41% in 1975 to 116,000 tons, and imports from China by the U.S.S.R. decreased 35% to 61,000 tons. The Tao-Ling mine and plant in Hunan Province continued to be the largest fluorspar producer in China.

France.—Fluorspar production decreased 13% to 378,000 tons, about one-half of which was acid-spar. Ore assays continued to drop, reaching an average of 45% CaF_2 in 1975. Exports, 67% to West Germany and the remainder to Western Europe and Canada, decreased 25% to 121,000 tons; most of this exported product was met-spar. Imports nearly quadrupled to about 18,000 tons, mainly because of shipments of acid-spar from Morocco that began in 1975.

Italy.—Fluorspar production decreased 7% to 255,000 tons about 90% of which was acid-spar. Exports, more than 90% acid-spar, increased 12% to 93,000 tons, mainly to the United States and West Germany. Exports to the United States decreased 25% to about 30,000 tons. Exports to the U.S.S.R., about 12,000 tons, were begun in 1975. A total of about 40,000 tons, 78% met-spar, was imported mainly from Mexico and France. Italy had large stockpiles of fluorspar at yearend. Chimica de Fluoro Sardo SpA, closed its operation at Santa Lucia, Sardinia; capacity was about 20,000 tons of acid-spar. Soricom SpA, a consortium of Southland Mining of Australia and Associates, was developing the Piansiano fluorspar deposit north of Rome. They were unable to produce acid-spar, but planned an annual output of 110,000 tons of briquets by late 1978.

Kenya.—Fluorspar production in Kenya increased 42% to 60,000 tons in 1975 as a result of commissioning a flotation plant, by the Fluorspar Co. of Kenya, which went onstream in March. Reported annual capacity of this plant was 165,000 tons of acid-spar and 88,000 tons of met-spar. The company was 51% owned by the Government with the balance held in equal proportions by Bamburi Cement Co. and International Minerals & Chemical Corp. Exports to the United States began with the first shipment from this company in July and totaled about 12,000 tons in 1975. Shipments to Japan decreased 36% to about 17,000 tons. No shipments were made to the U.S.S.R. in 1975 or in 1974.

Mexico.—Mexican fluorspar production decreased 2% in 1975 to 1.20 million tons, 60% of which was acid-spar, and Mexico maintained its leadership with 23% of world production. It was evident that production could be increased readily because installed capacity was near 1.31 million tons and several expansion or development projects were in progress or being considered.

Among the expansion or development projects was the addition of new flotation units at operations of Compañía Minera Las Cuevas, doubling its acid-spar capacity to 100,000 tons per year. A similar expansion was underway at the Industrias Peñoles–Allied Chemical consortium mill at Compañía Minera Rio Colorado, where 180,000 tons annual capacity was to be added by 1976 to the existing 300,000-ton capacity. A new 77,000-ton-per-year flotation mill was brought onstream at the Minera San Fransisco del Oro facility. A cave-in at the small open pit Fluoros de Hidalgo mine reduced production by 50%. The mine was subsequently closed permanently. At Parral, Chihuahua, output of acid-spar was reduced pending full production at the HF plant of Quimica Fluor S.A. at Matamoros, Tamaulipas.

This new HF plant, located across the Rio Grande River from Brownsville, Tex., went onstream in June but was still in a trial period at yearend although reportedly on fulltime operation. Planned capacity of this modern plant was approximately 80,000 tons per year of 70% HF, and was expected to increase fourfold Mexico's internal consumption of acid-spar. Exports of 70% HF to the United States increased sevenfold to about 14,000 tons.

During 1975, it was reported that the Mexican Government made some effort to organize the marketing of fluorspar including setting a minimum price; those ideas were shelved because of strong industry resistance. The newly formed Mexican Fluoride Institute, which reportedly was instrumental in preventing those government actions, acquired a permanent staff and a full-time director general. Industry had a majority of delegates in this institute although the Government also was represented.

Exports of fluorspar decreased 22% in 1975 to 931,000 tons, 89% of which went to the United States. Exports of acid-spar and met-spar to the United States decreased 24% and 27%, respectively, to 460,000 tons and 334,000 tons. Approximately 67% of all U.S. deliveries[4] of fluorspar originated in Mexico during 1975 compared with 69% in 1974. Exports to Canada remained at 118,000 tons. Exports to Italy decreased 26% to 19,000 tons. Plans to further diversify the Mexican export market were indicated.

Apparent inventory buildup was approximately 200,000 tons based on production and export data and allowing for a domestic consumption of 60,000 tons.

Mongolia.—Mongolia continued as a significant world producer of fluorspar with an estimated 1975 production of 334,000 tons, all of which was exported to the U.S.S.R. It was announced that the capacity of Behrin mine would be doubled.

Morocco.—The new mine and flotation mill operated by Samine at El Hamman near Khemisset, 50 miles east of Rabat, completed its first full year of operation. This more than doubled Moroccan production to 52,000 tons in 1975.

---

[4] Deliveries equal U.S. imports + domestic shipments per table 1.

Spain.—Total fluorspar production in 1975 increased 3% to 411,000 tons; about two-thirds was acid-spar. Minerals y Productos Derivados S.A., one of the two major producers, announced plans to build a flotation mill at Cucana in northern Spain; however, the depressed market prevented any action during 1975. Total exports, mainly to the United States and West Germany, decreased 12% to 247,000 tons. Exports to the United States decreased 17% to 156,000 tons. Large producers' inventories had accumulated by yearend, and price cutting occurred. Expected production was down for 1976.

Thailand.—Approximately one-half of the fluorspar mines in Thailand closed in 1975 because of lowered overseas demand, particularly in Japan, and because of instability, both real and suspected, in government mining policy. Total 1975 production decreased 38% to 269,000 tons, about 70% as met-spar and the balance as acid-spar. Total exports decreased 31% to 233,000 tons, about one-third of which was acid-spar. Exports to Japan also decreased 33% to 140,000 tons, 9% of which was acid-spar. Shipments of met-spar to the U.S.S.R., based on export data, were down 16% to 62,000 tons despite repeal of Revolutionary Decree No. 53 controlling trade with centrally controlled economy countries.

Tunisia.—Production of chemical-grade fluorspar increased 20% to 37,000 tons. However, exports decreased by more than 50% to 12,000 tons.

United Kingdom.—Fluorspar production in 1975 decreased approximately 1% to 254,000 tons. Operations at C.E. Giulini Ltd.'s acid-spar flotation plant and mine at Derbyshire were suspended in August. The plant had been operating since 1972 with annual production at about 40,000 tons. Operations were suspended pending clarification of mining rights in a national forest and also because of environmental problems. Approximately 70% of total British production in 1975 was acid-spar. British Steel Corp., the largest met-spar producer in the United Kingdom, continued development of its new Allenheads mine in eastern Cumbria and finally received permission at midyear to plan construction of a processing plant. A threatened 1977 closing of Laporte Industries Ltd.'s Cavendish mill near Eyam, the largest acid-spar mill in the United Kingdom, was averted by a Government ruling in May allowing construction of a waste disposal lagoon in the Peak District National Forest.

U.S.S.R.—In 1975, fluorspar production increased about 5% to an estimated 525,000 tons, and imports remained at about 540,000 tons. Total estimated consumption was steady at about 1.0 million tons; over three-quarters of this was used in the Soviet steel industry. Expansion of the Yaroslavsk complex in the Maritime Kray was completed in October whereby capacity was doubled to allow processing of about 750,000 tons of ore per year.

No imports were received from Japan and Kenya in 1975; 64,000 tons had been received from these two sources in 1974. Importation of small tonnages of fluorspar began from Western Europe, a total of 14,000 tons being received from Italy and Spain in 1975.

Grand total	[r] 5,214,659	5,337,018	5,093,768

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the countries listed, Bulgaria is also believed to have produced fluorspar, but production is not officially reported, and available information is inadequate for formulation of reliable output level estimates.

[2] An effort has been made to subdivide production of all countries by grade (acid, ceramic and/or metallurgical). Where the subdivision is available in official reports of the subject country, the data have been entered without qualifying notes; where a secondary source has been used to subdivide production by grade, the source of the basis for this subdivision has been identified by footnote. Where no basis for subdivision is available, the country entry has been identified with the notation "grade unspecified."

[3] Information on grade obtained from: Bundesanstalt Für Bodenforschung Hannover and Deutsches Institut Für Wirtschaftsforschung Berlin, Untersuchungen über Angebot und Nachfrage Mineralischer Rohstoffe IV—Flusspat, March 1974, p. 39.

[4] Actual reported production; not exports.

[5] Figures represent the difference between reported exports (divided by grade) and total production (reported without differentiation by grade), and presumably are domestic consumption plus or minus changes in stocks of both acid and metallurgical grade.

[6] Data for Brazil exclude some crude ore mined but neither sold as direct shipping ore nor beneficiated during year specified. Total crude ore production was as follows in short tons: 1973—121,427; 1974—116,705; 1975—NA. Of this output, crude ore beneficiated totaled as follows in short tons: 1973—95,342; 1974—97,044; 1975—NA; producer's initial stocks (as of January 1) totaled as follows in short tons: 1973—1,827; 1974—3,167; 1975—11,704; producer's yearend stocks totaled as follows in short tons: 1973—3,167; 1974—11,704; 1975—NA; and transfers totaled as follows in short tons: 1973—21,096; 1974—9,568; 1975—NA.

[7] Revised to zero.

[8] Marketed production estimated from domestic consumption and trade does not take into account changes in stocks. Total run-of-mine production (direct shipping ore plus ore destined for concentration) was as follows in short tons: 1973—628,000; 1974—761,000; 1975—805,000. Much of this material requires beneficiation before it becomes a salable product.

[9] Spanish figures revised to eliminate duplication detected in previous editions of this chapter.

[10] Includes materials recovered from lead-zinc mine dumps.

[11] Although official sources record no production, there are indications that at least test lots were produced.

[12] Acid grade material reported for Thailand is a beneficiated product resulting from processing low grade material officially reported; metallurgical grade material is run-of-mine material reported under the term "high grade." Recorded production of low grade material was as follows in short tons: 1973—377,151; 1974—375,623; 1975—192,814.

[e] Estimate. XX Not applicable.

[1] Compiled from official import data of listed countries of destination except where otherwise specified by footnote; figures in total receipts by listed countries column are simply summations of reported imports for all listed destinations, in contrast to figures in total recorded exports column which are either (1) actual reported exports of listed source countries, or (2) estimates of total exports. Differences between these two columns are attributed to (1) time lag between date of shipment and date of receipt, (2) concealment policies of some countries, and/or (3) reshipment of material by intermediate countries which may be credited as the origin in the trade returns of the final destination countries.

[2] Imports for year beginning July 1, 1974.

[3] No recorded production of fluorspar; exports are apparently derived from imported materials.

[4] Official import statistics show no receipts from this country, but do include a substantial quantity of material from undisclosed sources. Figure entered here represents reported export of source country to this destination. (An equal amount has been subtracted from the destination country's reported import from undisclosed sources).

[5] Data compiled from official import statistics of six nations and export statistics of 10 significant producing nations, the latter to determine apparent imports for 15 other countries for which official fluorspar import figures are not available. Nations reporting imports and total recorded imports for each are as follows in short tons: Brazil 68,614; Denmark 2,611; Finland 5,721; India 18,061; Mexico 30; Spain 19. Nations for which apparent imports have been derived, and apparent imports for each are as follows in short tons: Algeria 112; Argentina 606; Bulgaria 357; Hungary 1,929; Indonesia 65; Philippines 496; Romania 3,392; Singapore 110; the Republic of South Africa 61; Switzerland 2,319; Taiwan 3,932; Thailand 165; Turkey 391; Venezuela 18; Vietnam 539.

[6] Figure compiled from both the official import statistics of the countries of destination and official export statistics for the country of origin (see footnote 5).

[7] Figure compiled exclusively from official export statistics of the country of origin (see footnote 5).

[9] Figure includes fluorspar as well as any feldspar, nepheline and/or nepheline syenite exported.

TECHNOLOGY

The National Academy of Sciences began a study on the possible depletion of the protective ozone in the earth's upper atmosphere by reaction of the ozone with chlorofluorocarbon-decomposition products. Chlorofluorocarbon levels measured by the University of Denver[5] at 60,000 feet over New Mexico indicated an average increase of 14% per year during the period 1968 to 1975. This rate of increase was noted to be about the same as the average annual increase in chlorofluorocarbon use.

The Federal Bureau of Mines continued studies on recovery of byproduct H_2SiF_6 from phosphate rock processing for fertilizer manufacture. A semicontinuous process was being evaluated on a small scale using recycled phosphoric acid rather than sulfuric acid for acidulation of the rock. About 80% of the fluorine in the feedstock was evolved as water-scrubbable gaseous H_2SiF_6. Commercial processing recovers less than 50% of the fluoride in phosphate rock.

The amount of fluorspar flux used per ton of steel was reduced by more efficient utilization and by mixing fluorspar with less desirable substitutes such as ilmenite, olivine, and colemanite. However, no universal substitute has been found for fluorspar in steel manufacture.

A new British technique was reported[6] for converting fluosilicic acid into hydrogen fluoride. The process was claimed to accept very dilute, 2% fluosilicic acid or less, offstreams from phosphate rock processing and involves conversion to ammonium fluoride, then to alkali fluorides, and finally to hydrogen fluoride. The process has been demonstrated only on a small scale.

Three new applications of fluorocarbons in medical technology were reported.[7] The potential of gaseous chlorofluorocarbon gases as inhaled anesthetics was demonstrated on animals, and possible marketing by 1982 was indicated. Use of liquid fluorocarbons as replacements for blood was demonstrated in monkeys; life-sustaining oxygen was transported in solution in the liquid. Use of brominated fluorocarbons in radiography of lungs, the gastrointestinal tract, and the central nervous system was demonstrated with humans; the material is less toxic than the barium and iodine organic compounds now in use.

Gallium

By Benjamin Petkof[1]

Domestic gallium production increased above that of 1974. Although data on rest-of-world gallium production were not available, it was believed to have declined. Most gallium consumption continued to be in the production of various gallium compounds used to produce gallium-based electronic devices.

Table 1.—Salient gallium statistics in the United States
(Kilograms)

	1972	1973	1974	1975
Production	W	W	W	W
Imports for consumption	6,066	11,124	6,536	6,830
Consumption	5,076	8,496	r 6,939	7,493
Price per kilogram dollars	750	750	750	750–800

r Revised. W Withheld to avoid disclosing individual company confidential data.

DOMESTIC PRODUCTION

Domestic gallium production increased significantly from that of 1974, but data cannot be published in order to avoid disclosing individual company operations. Two companies produced metallic gallium in 1975. The Aluminum Co. of America (Alcoa), using proprietary gallium production technology, produced metal at its Bauxite, Ark., plant as a byproduct from residues of its alumina production process. Eagle-Picher Industries Inc. produced gallium metal, oxide, and trichloride from zinc production residues at its Quapaw, Okla., facility. Canyonlands 21st Century Corp. reprocessed gallium from gallium arsenide at its plant in Blanding, Utah. Other domestic companies produced high-purity gallium metal and gallium compounds such as arsenide, oxide, phosphide, and trichloride for the manufacture of electronic devices. Increasing demand for gallium-based devices by the electronics industry was expected to stimulate future domestic gallium production.

CONSUMPTION

Total domestic gallium consumption increased 8% in 1975. Almost the entire consumption of high-purity gallium metal was used to manufacture light-emitting diodes and semiconductor devices; the remainder was used for research and development, and the preparation of dental alloys. A small quantity of commercial-grade material was also used for research and development. Gallium in intermetallic compounds (arsenide, phosphide, and arsenide-phosphide) was also used for the manufacture of light-emitting diodes and semiconductor devices. Gallium in the form of oxide was used for the preparation of phosphors.

The wide acceptance of devices such as solid state calculators, digital clocks and watches, and visual display instrumentation using gallium-based components has greatly stimulated the demand for gallium. In addition, the capability of producing gallium-based, light-emitting diodes of various colors and the metal's potential use for solar cells for the production of electricity will probably enhance the future demand for gallium.

r Revised.

[1] Consumers only.

[2] Ending stocks for 1974 do not equal 1975 beginning stocks because of reported beginning stock adjustments.

PRICES

Prices paid for gallium are subject to negotiation between buyer and seller and are not reported. However, during the year, the American Metal Market quoted metal of 99.999% purity at $750 to $800 per kilogram in 100-kilogram lots.

FOREIGN TRADE

Data on exports of gallium materials are not reported separately and are included in the category, "base metals and alloys, not elsewhere classified, wrought or unwrought, waste and scrap."

Total U.S. imports of gallium increased about 5% in quantity and decreased 13% in value from that of 1974. Gallium from the Netherlands and Switzerland accounted for 92% of imports. The average value of imports was $520 per kilogram.

Table 4.—U.S. imports for consumption of gallium (unwrought, waste and scrap), by country

Country	1974		1975	
	Kilograms	Value	Kilograms	Value
Belgium-Luxembourg	2	$1,502	--	--
Canada	59	38,070	242	$129,745

Total	6,536	4,106,742	6,830	3,555,355

[1] Less than ½ unit.

WORLD REVIEW

World production data for gallium are not available, but gallium production probably followed the general world economy and declined during 1975.

Germany, West.—Swiss Aluminium Ltd. stated in its annual company report that there was a strong decline in its gallium business and production was curtailed at its Bergheim-Erft plant. The company also reported that demand picked up at yearend but at depressed prices.

Peru.—A recent report provided an estimate of the gallium resources available in the country's zinc resources. Reserves were reported as 660 metric tons and indicated resources, 1,660 metric tons. This provided a total national resource of 2,320 metric tons.[2]

TECHNOLOGY

The experimental production of a more efficient gallium-arsenide solar cell was announced. The cell, 1/3-inch in diameter, produced 10 watts of electricity by using highly concentrated sunlight. A 20% efficiency was claimed for the conversion of sunlight to electrical energy.[3]

A method was developed to recover gallium from solutions formed by the caustic digestion of bauxite. The solution was treated with carbon dioxide to precipitate alumina and gallium oxide. The precipitates were recirculated through additional solution for a long period of time in order to precipitate additional gallium oxide from solution.[4]

Vapor-phase epitaxy was used to grow gallium arsenide on a germanium substrate. The initial growth of the gallium arsenide layer was described.[5] Rapid growth in the first 5 minutes covered the substrate with a gallium arsenide layer that was built up at a steady rate. Scanning electron micrographs of the gallium arsenide layers revealed that the substrate surface was chemically attacked.

Analytical chemical methods for determining gallium were described.[6]

A report presented some thermodynamic properties of gallium-antimony alloys.[7]

Gem Stones

By Robert G. Clarke [1]

The value of gem stones and mineral specimens produced in the United States during 1975 was estimated to be $8.7 million, an increase of 90% over that of 1974. The domestic commercial mining industry contributed most of the increase, particularly in the production of turquoise. Amateur collectors accounted for much of the activity in many States. Commercial operators sold mainly to wholesale or retail outlets and also to jewelry manufacturers.

DOMESTIC PRODUCTION

Mines and collectors in 39 States produced gem materials estimated at $1,000 or more in value for each State. Ten States supplied 91% of the total value, as follows: Arizona, $5 million; Nevada, $1 million; Oregon, $500,000; Montana, $400,000; California, $220,000; New Mexico, $200,000; Texas, $160,000; Washington, $160,000; Wyoming, $140,000; and Colorado, $135,000.

Park authorities at the Crater of Diamonds Park in Arkansas reported the finding of the second largest diamond ever found in the area.[2] The diamond, 16.37 carats in weight, was flawless and clear white. The rough value was placed at $15,000; when finished, the stone will be worth $80,000 to $100,000.

Several minute diamond crystals were discovered in a rock sample from a diatreme in Wyoming, according to geologists who have been examining pipelike intrusions of igneous rock in the Rocky Mountain area.[3]

In Nevada, the explosion in demand for turquoise jewelry resulted in an increased value of gem stone production of 150% from an estimated $400,000 in 1974 to $1 million in 1975. To help individuals learn more about collecting localities in Nevada, a "map" was published of the State's rocks and minerals.[4]

The quantity and value of emerald, jade, opal, and sapphire were withheld to maintain confidentiality of reporting producers. Peridot was produced by about 200 individuals of the San Carlos Apache Tribe at Peridot, Ariz.; no estimate of quantity and value of the peridot was available.

The production of turquoise of all grades and quantities was nearly 586 tons, valued at $5.2 million, and was principally from Arizona, Colorado, and Nevada. The great interest in American Indian style jewelry continued throughout 1975. Many articles appeared in various publications describing the qualities of genuine turquoise and Indian jewelry.

The discovery of tourmaline in Maine initially occurred in August 1972. The discovery and subsequent development were described in detail.[5] Tourmaline has appeared in jewelry stores occasionally in the past, but the discovery at Newry assured a regular supply. Retail prices in

——. The Story Beyond the Story of the Great Tourmaline Discovery. Lapidary J., v. 29, No. 5, August 1975, pp. 994–1001.

1975 ranged from about $8 per carat for small, slightly flawed stones to $100 per carat for large stones of good color weighing about 50 carats.

In addition to emerald, North Carolina is also the source for rhodolite, a garnet varietal. Western North Carolina is invariably associated with rhodolite garnets and probably the world's only supplier. A description of the area where rhodolite is found was published with complete instructions for gem seekers at the dig-for-fee mine.[6]

Accurate and up-to-date information for collecting areas is difficult to maintain. A listing of fee-basis and free digging areas for agate and other gem materials in central Oregon was provided with the cautionary advice to inquire in advance to verify the information.[7]

Custer, S. Dak., has been called the rose quartz capital of the world. In addition, four totally new minerals were discovered in the area: Jahusite, robertsite, segelerite, and wylheite.[8]

Producers of gem stones in the United States, by principal gem stone reported, follow:

CONSUMPTION

Domestic gem stone output was utilized for amateur and commercial rock, mineral, and gem stone collections, objects of art, and jewelry. Apparent consumption of gem stones (domestic production plus imports minus exports and reexports) was $468 million, about 17% more than in 1974.

PRICES

Typical costs to a retail jeweler in December 1975 for representative better quality gem stones as reported by 15 typical importers follow:[9]

Gem stone	Carat weight	Median price per carat	Price range per carat
Amethyst	10	$12	$8–$20
Aquamarine	8	95	50–250
Black opal	3	450	200–1,500
Cat's eye	5	1,000	700–1,250
Citrine	10	5	4–8
Emerald	1	1,700	750–12,000
Green garnet	1	425	400–500
Man's sky blue star	10	225	85–500
Peridot	10	45	25–70
Ruby	2	2,000	850–15,000
Sapphire	2	650	350–3,500
Tanzanite	5	200	200–260
Tourmaline, green	10	55	30–80
Tourmaline, pink	10	70	25–90
White opal, fiery	5	65	35–120

NOTES.—Ten-carat cat's eyes and 15-carat peridot, both of which were on the 1974 list, became unavailable during 1975, but the median price per carat of the smaller stones held at the levels of the larger stones.

No survey was made of diamond prices; price trends indicated higher prices for cut diamond 1 carat and smaller, but no change in larger cut diamond.

FOREIGN TRADE

Exports of all gem materials amounted to $257.2 million, and reexports to $133.7 million. Diamond accounted for 92% of the value of both exports and reexports. Exports of diamond totaled 264,873 carats valued at $237.0 million. Of this total, diamond cut but unset, suitable for gem stones, not over 0.5 carat, was 50,180 carats valued at $15.2 million; and cut but unset, over 0.5 carat, was 209,427 carats valued at $220.7 million.

Reexports of diamond amounted to 1,178,482 carats, valued at $122.7 million, in categories as follows: Rough or uncut, suitable for gem stones, not classified by weight, 1,049,903 carats valued at $79.4 million; cut but unset, not over 0.5 carat, 44,089 carats valued at $10.1 million; cut but unset, over 0.5 carat, 84,490 carats, valued at $33.1 million.

The eight leading recipients of diamond exports accounted for 84% of the carats and 96% of the value and were as follows: Hong Kong, 82,136 carats valued at $94.3 million; Japan, 40,484 carats, $33.5 million; Switzerland, 40,643 carats, $31.8 million; the Netherlands, 21,894 carats, $24.9 million; Belgium, 13,986 carats, $20.5 million; France, 6,598 carats, $9.3 million; West Germany, 3,885 carats, $7.6 million; and the United Kingdom, 12,878 carats, $6.5 million.

---

[9] Jewelers' Circular-Keystone. JC-K's Colored Stone Price Index. V. 146, No. 4, January 1976, p. 124.

The eight leading recipients of diamond reexports accounted for 97% of both carats and value and were as follows: Israel, 506,473 carats valued at $35.0 million; Belgium, 363,304 carats, $33.4 million; the Netherlands, 181,990 carats, $21.7 million; Switzerland, 7,343 carats, $7.1 million; the United Kingdom, 45,784 carats, $6.9 million; Japan, 9,472 carats, $6.2 million; Hong Kong, 8,953 carats, $4.7 million; and France, 18,578 carats, $3.8 million.

Exports of all other gem materials amounted to $20.2 million. Of this total, pearls, natural and cultured, not set or strung, were valued at $0.4 million. Natural precious and semiprecious stones, unset, were valued at $16.7 million; and synthetic or reconstructed stones, unset, were valued at $3.1 million. Reexports of all other gem materials amounted to $19.9 million in categories as follows: Pearls, $10.0 million; natural precious and semiprecious stones, unset, $9.8 million; synthetic or reconstructed stones, unset, $0.1 million.

Imports of gem materials decreased about 4% in value from those of 1974. Diamond accounted for 85% of the total value of gem material imports.

Although rough and uncut diamond imports were reported from 22 countries, over 99% of the value was from 10 areas, as follows: The Republic of South Africa, 926,738 carats, $189.9 million; the United Kingdom, 450,689 carats, $70.0 million; Sierra Leone, 272,331 carats, $32.7 million; the Netherlands, 36,132 carats, $13.6 million; Belgium-Luxembourg, 30,988 carats, $8.3 million; Venezuela, 389,146 carats, $8.2 million; Southwest Africa, 36,206 carats, $6.6 million; Israel, 32,574 carats, $5.5 million; Central African Republic, 134,068 carats, $5.3 million; and Liberia, 3,870 carats, $5.0 million.

Cut but unset diamond, not over 1/2 carat, was imported from 35 countries; however, the imports of this category from 8 countries amounted to 98% of total carats and value as follows: Israel, 834,875 carats, $125.7 million; Belgium, 729,438 carats, $105.4 million; India, 299,214 carats, $36.9 million; the U.S.S.R., 44,634 carats, $9.1 million; the Netherlands, 48,194 carats, $6.4 million; the Republic of South Africa, 14,254 carats, $4.0 million; the United Kingdom, 15,836 carats, $2.1 million; and France, 17,910 carats, $2.0 million. Cut but unset diamond, over 1/2 carat, was imported from 32 countries; the imports from 6 countries amounted to 98% of total carats and value as follows: Belgium, 121,122 carats, $48.6 million; Israel, 72,606 carats, $22.6 million; the Republic of South Africa, 7,636 carats, $4.5 million; the Netherlands, 10,183 carats, $3.9 million; the U.S.S.R., 12,831 carats, $3.8 million; and the United Kingdom, 1,094 carats, $0.5 million.

Imports of emeralds decreased 7% in quantity but increased 19% in value. Emeralds were imported from 33 countries of which the 10 leading countries accounted for 94% of the carats and 92% of the value. In order of value these countries were as follows: Colombia, $13.0 million; India, $6.8 million; Switzerland, $4.6 million; Hong Kong, $3.3 million; Brazil, $2.9 million; France, $2.2 million; the United Kingdom, $1.3 million; Sri Lanka, $1.3 million; Israel, $1.0 million; and West Germany, $0.8 million. Imports of rubies and sapphires decreased 9% in value from those of 1974. Ruby and sapphire imports were reported from 36 countries of which the 7 leading countries accounted for 95% of the value as follows: Thailand, $12.3 million; Sri Lanka, $1.9 million; Hong Kong, $1.2 million; India, $1.1 million; Switzerland, $1.0 million; the United Kingdom, $0.4 million; and France, $0.4 million. Natural pearls and parts from 12 countries increased 53% in value of imports; 4 countries accounted for 97% of the value as follows: Canada, $63,000; India, $365,000; Burma, $157,000; and Japan, $67,000. Cultured pearls, on the other hand, decreased 18% in value of imports, which were received from 16 countries, although Japan, at $7.0 million, accounted for 97% of the value. Imports of imitation pearls decreased 49% in value; Japan, at $469,000, accounted for 91% of the value. Coral, cut but unset, along with cameos suitable for use in jewelry, more than doubled in value of imports, which were received from 19 countries; 3 countries accounted for 97% of the value as follows: Italy, $4.9 million; Japan, $0.8 million; and Taiwan, $0.5 million.

Imports of other precious and semiprecious stones, rough and uncut, increased 37% in value and came from 41 countries of which 6 countries accounted for 75% of the value as follows: Brazil, $1.8 million; Colombia, $1.0 million; Australia, $1.0 million; the Republic of South Africa, $0.5 million; Tanzania, $0.3 million; and Venezuela, $0.2 million. Other precious and semiprecious stones, cut but unset, decreased only 1% in value and were imported from 58 countries, of which 7 countries accounted for 84% of the value as follows: Hong Kong, $10.6 million; Brazil, $3.6 million; West Germany, $3.1 million; Australia, $2.7 million; Taiwan, $1.7 million; India, $1.2 million; and Iran, $1.1 million. Synthetic gem stones, cut but unset, increased 27% in value and came from 19 countries of which 7 accounted for 99% of the value as follows: West Germany, $4.8 million; Switzerland, $0.7 million; Japan, $0.7 million; France, $0.6 million; Hong Kong, $0.6 million; Taiwan, $0.3 million; and Austria, $0.2 million. Imitation gem stones decreased 27% in value from 24 countries; 5 countries accounted for 99% of the value as follows: Austria, $3.3 million; West Germany, $2.8 million; Czechoslovakia, $1.1 million; Japan, $0.7 million; and Hong Kong, $0.3 million.

WORLD REVIEW

Angola.—The production of diamond in Angola declined in 1975 owing to the political chaos caused by the collapse of public authority following the exodus of the Portuguese. The principal diamond producing company was the Portuguese firm, Compania de Diamantes de Angola (Diamang), which was reported to be in financial difficulties.[10] Diamang's production was from alluvial diamond-bearing gravels in areas drained by the major river systems of central and southern Angola. Stripping was the mining method used, and was accomplished by mechanical excavators and hydraulic monitors, as well as manual shovels.

Australia.—It was estimated that 95% of the amount of opal used in jewelry in the world comes from six deposits in Australia.[11] More than half of the production is from the area of Coober Pedy. In 1973, the value of opal exported from Australia was officially reported to be $27 million, but unofficial estimates were much higher. It is simple to smuggle out high-quality opal following cash and carry deals. Mining methods have been mostly by hand digging to be gentle with the opal. Lately, however, bulldozers and rippers have been used to strip the surface, and then hand digging is used to remove opal as it is exposed.

The Mining Houses of Australia Ltd., having ceased sapphire mining operations, offered to sell its sapphire stockpile to shareholders to liquidate its inventories.[12] However, a strong recovery in the sapphire market led to Dominion Mining's resumption of full-scale operations at its Frazers Creek property in New South Wales.

Botswana.—The Government of Botswana and De Beers Botswana Mining Co. concluded negotiations relating to the terms governing diamond mining at Orapa and Letlhakine (formerly the DK 1 and DK 2 complex).[13] Production at Orapa will be increased to 4.5 million carats per year by 1979 from the present 2.4 million carats. The Letlhakine mine is expected to produce about 400,000 carats annually by 1979.

At Orapa in 1975, the tonnage treated was 3,359,832 short tons, compared with 2,953,628 tons treated in 1974.[14] The recovery grade was 79.19 carats per 110 short tons, compared with 92.03 carats per 110 tons in 1974. Two X-ray sorting machines were in use, and two additional machines were being installed in a new circuit.

Brazil.—Results of a 4-year aerial infrared photographic survey of the Amazon region indicated areas suitable for prospecting for diamond in the Tumucumaque mountains and in Roraima. This prompted Anglo American Corp. (AAC) to join Income (Bethlehem Steel Corp./Hanna Mining Corp.) to form Sopermi (40% AAC, 60% Income), an exploration firm which is active in Minas Gerais and Mato Grasso.[15]

Canada.—No occurrences of precious gem stones have been found in Canada, but a variety of other gem stone minerals are available. The main geological regions and some important gem stone areas were described in an article which was well illustrated by color photographs.[16]

Central African Republic.—The output of diamond in 1975 in the Central African Republic was 339,000 carats, about the same as in 1974, and the value was $14.7 million compared with $14.4 million in 1974. In spite of lower dollar exchange rates, the income was higher owing to improved gem stone quality and increased prices of diamond.

Diamond in the Central African Republic, to date, has been mined in alluvial fans, basins, water courses, and streambeds. Because these formations are not conducive to large-scale mining operations, most diamond mining has been by individuals and small groups. However, diamond recovery at these small operations has become more difficult, and a shift to large-scale operations was needed, requiring larger capital expenditures. To maintain and expand production, Diamond Distributors International Inc. (United States), Cominco, Ltd. (Canada), and the Government of the Central African Republic established a local firm, Société Centrafricaine d'Exploitation Diamantifére (SCED), in late 1973 to meet these objectives. SCED has had two successful years and has been largely responsible for maintaining the production of diamond in the Republic at the 1974–75 levels.

The quality of diamond is good as 60% to 70% are of gem grade. Most stones are exported uncut to Europe, Israel, or the United States. Skilled Central African artisans in Black Africa's only diamond cutting factory cut about 5% of the gem diamond production. In 1974, diamond exports to the United States were valued at $6.8 million for gem quality and $464,000 for industrial diamond. Diamond exports comprise an important element in the foreign exchange earnings and tax revenues of the Republic. Over the past 10 years about 30% of its foreign exchange earnings have been from diamond exports.

Colombia.—Bids were invited from private companies for mining rights at the three largest emerald deposits in the Department of Boyacá, at Muzo, Coscuez, and Peñas Blancas, which have been closed since Empresa Colombiana de Minas (Econominas) ceased operations in July 1973.[17] The successful companies, which must be at least 51% Colombian owned, would have an initial lease for 5 years with the possibility of an extension for a further 3 years; Econominas will continue to be responsible for overall control of the deposits. The mining district was described as too rich for a poor country, leading to violence.[18]

Ghana.—The total production of diamond in Ghana is probably fifth in the ranking of countries in the world, but nearly 90% of Ghana's production is industrial grade.[19] Gem diamond in the 2- to 4-carat range was recovered in a dredging operation by Dunkwa Goldfields Co. on the Jimi River in the Ashanti region. Small gem stones were also recovered in the Bonsa Valley of Western Ghana. The First International Natura Corp., New York, with substantial U.S. investment, negotiated with the Government of Ghana for mining rights on a 25-square-mile area at the confluence of the Birim and Pra Rivers. The Government will have 55% equity in the project when negotiations are concluded.

Diamond production is marketed exclusively by the Government's Diamond Marketing Corp. (DMC). DMC buys all local diamond production, and grades, values, processes, and sells to end users abroad. The sales of diamond abroad were made with the assistance of Consolidated African Selection Trust in London. The majority of diamond exports were made to the United Kingdom, the Netherlands, and Belgium-Luxembourg.

Israel.—The diamond industry in Israel was said to be the world's largest.[20] Exports of polished diamond in 1975 were 2,701,388 carats, compared with 2,467,008 in 1974, an increase of 9.5% according to statistics of the Diamond Department of the Ministry of Commerce and Industry. The contemporary market demand for smaller stones resulted in a 2.4% decrease in the value of 1975 exports, $548.6 million compared with the record $562.2 million in 1974. The U.S. market accounted for $153 million out of Israel's total 1975 exports. In concentrating on the smaller stones, it was estimated that in 1975 Israel produced 85% of the world's supply of melées (gem diamonds of from 40 stones per carat to 2 stones per carat). The wider application of automated equipment in many plants plus increased individual effort made possible greater output with approximately the same number of workers.

Lesotho.—After nearly 2 years of negotiations, Prime Minister Leabua Jonathan and De Beers Consolidated Chairman Harry Oppenheimer signed an agreement which will open a new diamond mine in Lesotho.[21] Control of the mine will be by a newly formed company, De Beers Lesotho Mining Co., Ltd., in which Lesotho will hold 25% equity. De Beers investment commitment is U.S. $35 million over 2 years.

The agreement permits development of Lesotho's only identified kimberlite diamond pipe at Letseng la Terae in the northeastern district of Mohkotlong. Output of the mine, will be marketed through a second company to be formed by De Beers and registered in Lesotho. Lesotho will charge a sales tax of about 15% on mine production until De Beers recovers its capital costs. Depending on the mine profitability, the taxes may rise to 71.5% of profits on a graduated scale.

Malagasy Republic.—The Malagasy Service of Mines reported production and export of a variety of gem and ornamental stones which contributed to the foreign exchange earnings of the Republic. The list included agate, amazonite, amethyst, beryl (gem grade), citrine, garnet (gem grade), opal, tourmaline, jasper, labradorite. rose quartz, and smoky quartz. The exports were mostly to collectors interested in minerals from the Island of Madagascar.

Pakistan.—The Pakistan Mineral Development Corp. recovered about 3,000 carats of rubies at the Hunza ruby mines for testing and evaluation in Karachi.[22]

Sierra Leone.—The 51% Government-owned National Diamond Mining Co. commenced prospecting in new areas of the Southern Province to replace diamond deposits nearing exhaustion. Diamond Distributors, International, Inc., of New York, acquired a prospecting license for diamond and gold.

South Africa, Republic of.—The Central Selling Organization reported diamond sales in 1975 of 793.5 million rands (US $1,066 million), or 6.5% less than in 1974.[23] During 1975, production exceeded sales, and the excess was absorbed into stock. No breakdown of either gem stones or industrial diamond sales was given. During 1975, demand for the smaller size of gem diamond improved, but the demand for larger, more expensive stones remained weak. To meet the demand for smaller stones, production at mines where the average stone size is smaller was increased and that of mines where the average is larger was decreased.

At the dormant Kimberly mine rains have caused severe slope failures in the drainage tunnel which was started in November 1975 and is expected to be completed in 1977. Also in the Kimberly Division, mechanization was accelerated to replace manual operations wherever possible in underground sections and on the surface under a program to phase out migratory labor.

South-West Africa, Territory of.—The Consolidated Diamond Mines of South West Africa (Proprietary) Ltd. reported an increase in ore treated in 1975 to 13,498,048 short tons from 13,047,780 tons in 1974. The average stone size decreased from 0.88 carat in 1974 to 0.73 carat in 1975. Overburden stripped increased from 45,074,540 tons in 1974 to 46,389,670 tons in 1975. Diamond production was higher in 1975 at 1,747,739 carats, compared with 1,569,961 carats in 1974.

The application of a well-point dewatering system together with the use of a bucket wheel excavator enabled mining to proceed up to 492 feet seaward of the high water mark, and extending operations to 656 feet appeared feasible.

U.S.S.R.—Soviet geologists, according to the Novost Information Service of Moscow, have discovered additional reserves of turquoise, other semiprecious stones, and industrial stones in Uzbekistan in Central Asia. The other stones included lazurite, chalcedony, onyx, quartz, and rhodonite. The Ministry of Geology added that a stone processing plant was already under construction to produce 322,920 square feet of ornamental stone tiles per year. Production of these stones in Uzbekistan will increase three or four times by 1980.[24]

• Estimate. [p] Preliminary. [r] Revised.

[1] Total (gem plus industrial) diamond output for each country is actually reported except where indicated to be an estimate by footnote. In contrast, the detailed separate reporting of gem diamond and industrial diamond represents Bureau of Mines estimates in the case of every country except Central African Republic (1973), Lesotho (1973–75), Liberia (1973–74), Guyana (1973), and Venezuela (all years), where sources give both total output and detail. The estimated distribution of total output between gem and industrial diamond is conjectural in the case of a number of countries, based on unofficial information of varying reliability.

[2] Exports of diamond originating in Lesotho; excludes stone imported for cutting and subsequently reexported.

[3] Exports.

[4] Partial figure, January 1 through December 15 only.

[5] All company output from the Republic of South Africa except that credited to the Premier mine; excludes company output from the Territory of South-West Africa and Botswana.

TECHNOLOGY

Turquoise may be of inferior quality or may be confused with other materials to the disadvantage of the owner of the turquoise. For example, chrysocolla is identified frequently as turquoise. A simple test will help identify the sample correctly.[25] A drop of commercial grade of hydrochloric acid (HCl), commonly called muriatic acid (32% HCl), is placed on the sample. If it is chrysocolla, the acid will turn to a greenish-yellow color which can be easily observed by blotting it with a white tissue. No reaction will take place on fair to excellent quality turquoise. Azurite and malachite will change the acid's color and they will effervesce also.

American Indian turquoise jewelry can also be difficult to assess. Advice to prospective buyers included cautions against fakes, mass-produced or machine-made jewelry labeled "Indian" creation, and even stolen jewelry.[26] The quality of the turquoise in the jewelry was also described for the benefit of prospective buyers.[27] The geographical distribution of turquoise in the United States is limited to the margins of the Colorado Plateau of the Southwestern States. With the aid of instrumental neutron activation analysis to detect trace elements, researchers are able to tell which turquoise came from which mine.[28] The information obtained from a study of turquoise artifacts from a pre-Columbian Indian village contributed knowledge to the trading patterns of the inhabitants.

[27] Albuquerque Journal. Turquoise Cost Up, But Watch Out. 93d Year, No. 3, Apr. 21, 1974, pp. 1–2.

The Job Safety & Health magazine of the U.S. Department of Labor indicated 10,000 lasers were in use by industry, and the boring of holes in diamond was noted.[29] A proposed safety code required protective housings, safety interlocks, visual and audible warning signals to alert operators in case of interlock failure and other steps to eliminate exposure to any radiation or other hazards.

The current process equipment and products of the semiconductor crystal industry were reviewed and predictions were made for the future state-of-the-art.[30] The processes which were described included the Czochvalski, float zone, pedestal growth, and zone leveling and procedures such as edge defined ribbon growth, dendritic web growth, Schmid Viechnicki, and cold crucible melting.

Natural diamond and most manufactured diamond are formed at high pressure. It is possible to synthesize diamond by growing it from existing diamond in a low-pressure gas rich in carbon.[31] It was found advantageous to have the seed diamond in powder form to take advantage of the large surface per unit of weight. Powder having a particle size of up to 1 micrometer has a specific surface of about 10 square meters per grain. It was also found that, if the diamond particles are suspended in the gas, such as methane by applied vibrations, the growth would be improved; the method could also yield threads, whiskers, or fibers of diamond.

Information about the earth's deep interior is scanty, and even inferences drawn from seismic and electrical conductivity measurements include assumptions about the relevant mineral species. Recently geophysical investigations applied improved techniques to suggest major revisions in the accepted hypothesis pertaining to the earth's lower mantle. The key to the new techniques is a device developed at the National Bureau of Standards and is known as a diamond-anvil or diamond-window pressure cell.[32] The device is not new, but its refinements and applications are. In addition to the work at the National Bureau of Standards, groups at the Geophysical Laboratory of the Carnegie Institution of Washington and at the University of Rochester contributed studies of chemical and physical properties.

The most prominent characteristic of minerals and gems is color. The cause of the color in many of these materials is frequently unknown or misunderstood, and many erroneous early guesses as to the causes of specific colors in minerals have been repeatedly copied from one text to the next so that much misinformation is current. Twelve distinct causes of color were described in three articles,[33] and brief outlines of four theories—crystal field, molecular orbital, band, and physical optics—were included.

The tumbling process has been in use about 30 years for polishing gem stones. The technique is more popular now than ever before, and an evaluation of tumbling was presented.[34] The shape of a tumbler may be round, hexagonal, or barrel. The material of construction may be glass, ceramic, plastic, rubber, or steel. The tumbler may have a fixed speed of rotation, or it may be variable. Tumblers may be open or sealed. Tumblers may rotate on a fixed or a variable axis, or may vibrate, usually on a vertical axis. The stones for the tumbler should be of similar grain, density, toughness, hardness, and porosity. The load should be exact, although most tumblers work well when about two-thirds to three-fourths full. The amounts of fluid or water, abrasive polishing media, and special additives are also variable. Because of all the possible variations, it was recommended that the instructions of the manufacturers be followed explicitly.

Gold

By J. M. West[1]

Gold prices trended downward in 1975 from historic highs reached at the end of 1974. Nevertheless, the average price for the year was slightly above that of 1974 at $161.49 per troy ounce versus $159.74 a year earlier (Engelhard prices for unfabricated gold). The highest price for the year was $185.75 on February 24 and the lowest price $129.25 on September 23. London final prices ranged between $128.75 and $185.25, averaging $161.02. Major factors influencing prices were sales of Treasury gold in January and June 1975 and the announcement at the end of August 1975—after previous discussions but no decisions—by the International Monetary Fund (IMF) that a sixth of that organization's gold stocks would be sold to provide capital for low interest loans to developing countries. By yearend the domestic price of gold had recovered somewhat to $140.75, a result of uncertainties about the timing of IMF sales, about whether central banks would be allowed to purchase the gold, and even whether the sales would take place at all. Another factor in the price recovery was increasing demand for consumer gold products in the second half of the year. Futures trading of gold, initiated on December 31, 1974, in New York and Chicago, had a stabilizing influence on prices and provided a means for producer-consumer hedging and speculative trading. Sizable deliveries were made to consumers from exchange stocks in New York and Chicago depositories during 1975.

r Revised.
[1] From domestic ores—U.S. Department of the Treasury, 1971–74, and Bureau of Mines, 1975.
[2] Excludes coins.
[3] Includes gold in Exchange Stabilization Fund.
[4] Gold content of all products in stocks held by manufacturers and refiners, 1971–74; gold content of bullion only in 1975 (excludes trading stocks). Stocks at beginning of 1975 amounted to 1,896,000 ounces of bullion.
[5] Engelhard Industries quotations.
[6] Held by market economy central banks and governments; gold valued at $38 per troy ounce in 1971–72, and $42.22 per ounce in 1973–75.

Again in 1975 U.S. markets were supplied with gold sold by foreign governments from stocks on deposit at the Federal Reserve Bank in New York. These sales totaled only 576,593 ounces compared with 2,144,000 ounces in 1974. Treasury sales supplied 1,253,500 ounces to domestic markets. Total gold imports amounted to 2.66 million ounces, slightly higher than in 1974, and exports totaled 3.50 million ounces, 10% lower than in 1974. Net bullion exports amounted to 0.75 million ounces. Exports were at a high in January and February. In addition to bullion and unrefined gold trade, coins estimated to contain 1.67 million ounces of fine gold were imported, down considerably from the 3.09 million ounces imported in 1974. Most coins were valued mainly for their bullion content and had small premiums for numismatic values. Supplies of gold amounting to 1,108,000 ounces came out of industry stocks, but the new futures trade exchanges absorbed an estimated 550,000 ounces in establishing the yearend 1975 stocks. Refining of old scrap contributed 1.12 million ounces to supplies (the balance of refined scrap is considered runaround scrap not affecting supply or demand). Mine production amounted to 1.05 million ounces, 7% lower than in 1974, and the Homestake mine in South Dakota continued as the top producer, accounting for 29% of total U.S. output. Nevada, however, became the first ranking State in gold production, followed by South Dakota, Utah, Arizona, and Colorado. The five States provided 92% of all mine production.

Domestic gold consumption continued the decline which began in the second half of 1972. During 1975 4.0 million ounces of bullion was consumed, 14% less than in 1974 and 45% less than the 1972 gold consumption.

Despite the manufacture of bullion products in a variety of forms for the investment market and extensive sales promotions, public demand failed to materialize for these items as an investment medium. After a brief flurry of sales at the beginning of the year, demand faded, partly satisfied instead by sales of imported gold coins. Later in the year coin sales began to lag and sales campaigns were mounted in several parts of the country to stimulate demand.

Trading volume on the major commodity exchanges was almost twice as high in the second half of the year as in the first half. Both the Commodity Exchange Inc. (COMEX), in New York, and the International Monetary Market (IMM), in Chicago, had volumes of about 36 million ounces for the year. Monthly trading volumes ranged from 0.89 to 4.65 million ounces on these exchanges.

For the fifth year in a row since the historic high of 47.5 million ounces in 1970, world gold production declined, reaching 38.6 million ounces in 1975. The Republic of South Africa, which supplied 68% of world production in 1970, was a source of 59% in 1975, with the U.S.S.R. increasing output to account for 19% in 1975. Canada remained the third ranking world producer in 1975 with 4% of the output, and the United States was fourth, with 3%.

Legislation and Government Programs.—Following the end of controls on the holding and trading of gold by U.S. citizens on December 31, 1974, the Department of the Treasury announced it would abolish the Office of Domestic Gold and Silver Operations, which had regulatory functions. The action was effective in mid-1975. Subsequently, for advisory purposes and to continue some of the functions, a Deputy Director of Gold Market Activities was established in the Office of Foreign Exchange Activities.

A revised list of charges was published for gold and silver assays by the Bureau of the Mint.[2] Ore sample assays were priced at $5 for gold or silver and $8 for both in one sample, the assays being made at the U.S. Mint, Denver, Colo. 80204. A notice was published terminating Treasury gold regulations and licensing functions.[3] Part 54 of the Federal Statutes, entitled Gold Regulations, was revoked in its entirety. The section of Treasury Rules and Regulations on gold coin and gold certificates (Title 31, Part 100, Sect. 100.4) was revised to read: Gold coins and gold certificates of the type issued before January 30, 1934, are exchangeable, as provided in this part, into other currency or coins which may be lawfully issued.

The U.S. Customs Service ruled that gold coins reproduced privately outside a government mint, or without official sanction, and imported into the United States, must be legibly marked in a conspicuous place to indicate the English name of the country of production. Such gold pieces were dutiable at the rate of 20% ad valorem. In addition, under the Hobby Protection Act, the unofficial pieces were required to bear the word "Copy," according to the Federal Trade Commission's Bureau of Consumer Protection.[4]

Congressional authority was granted to the American Revolution Bicentennial Administration and the U.S. Mint to produce three sizes of gold medals commemorating the Nation's Bicentennial. The gold was to come from U.S. Treasury reserves and the sizes, weights (in fine troy ounces content) and prices were as follows: 3-inch/ 13.18 ounce/ $4,000; 1-5/16-inch/ 1.167 ounce/ $400; and 29/32-inch/ 0.37 ounce/ $100.

The Treasury Department began a continuing program of gold sales through periodic offerings on an auction basis by the General Services Administration. Sales were held on January 6 when 754,000 ounces was sold at an average of $165.67 per ounce and June 30 when 499,500 ounces was sold at $166.05 per ounce. Further sales were anticipated by Treasury officials but none were scheduled during the remainder of the year. In August 1975 the sales were interrupted by the announced intention by IMF to sell 25 million ounces of its gold holdings at public auction. These plans were subject to further ratification in January 1976 when a time frame for the sales of about 4 years was established. Another 25 million ounces of gold was to be returned to the original donors. Meanwhile the possibility of further Treasury sales was reiterated. IMF had agreed at meetings in January and June 1975 to abolish the official price of gold. Further steps to abolish the official price were announced in January 1976, with a plan for monetary reforms.

On June 24 the Commodity Futures Trading Commission announced in the Federal Register regulations affecting trading in bullion and in gold and silver coins. The rules became effective as of the date of publication. Special attention was given to use of the mails in coin transactions.

Although it received no new funds for its program in 1975, the Office of Minerals Exploration, U.S. Geological Survey, retained authority to offer participatory loans for domestic gold exploration, with qualifying applicants eligible for up to 75% of approved costs. No new projects were funded in 1975.

DOMESTIC PRODUCTION

A drop in production at the Homestake gold mine, South Dakota, which, nevertheless, retained its position as the leading producer, and a continuing recession in the copper mining industry owing to low copper prices resulted in a 7% decline in U.S. gold production in 1975. Byproduct gold provided 36% of all gold produced in 1975 compared with 41% in 1974. Despite gradual phasing out of the Cortez gold mine operation, scheduled for closure in 1976, Nevada production rose 11%,

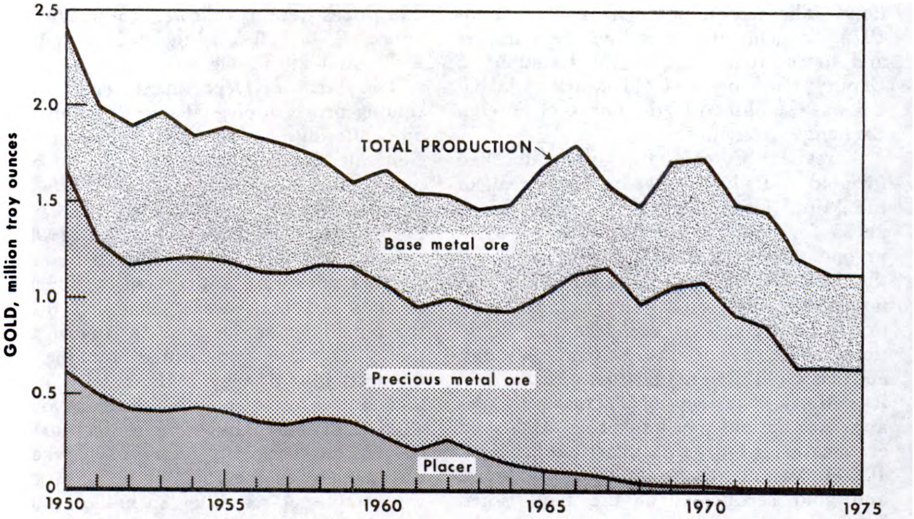

Figure 1.—Gold production in the United States by source.

mainly because of a 33% increase in output at the Carlin mine, the country's second leading gold producer in 1975. The third ranking producer was the Utah copper mine of Kennecott Copper Corp. Production was slightly lower in 1975 at the Knob Hill gold mine, Republic, Wash., and continued operations were doubtful owing to shortage of ore reserves. All Alaskan gold came from placer mining, the most significant new activity being at Nome where Alaska Gold Co. operated a rehabilitated bucketline dredge during the summer. The firm also continued dredging at Hogatza, in the Hughes district, north of Ruby, Alaska.

The four leading domestic producers accounted for 73% of total gold production in 1975; 95% came from the first 25 mines, 10 of which were operated mainly for gold or gold and silver. Placers contributed 2% of production. The number of placer mines reporting production rose to 49 from 43 in 1974. A portion of placer output continued to come from sand and gravel producers in California and Colorado where byproduct recovery units were maintained. A rehabilitated bucketline dredge came into operation at Hammonton, near Marysville, Calif., under the ownership of Yuba Goldfields, Inc., a new corporation, established to reopen dredging in an area last productive in 1968. A few thousand ounces was produced during the year. Standard Slag Co. opened the Atlanta gold mine, northeast of Pioche, Lincoln County, Nev., in early 1975 and produced by cyanidation at about the planned rate of 1,000 ounces per month.

Gold refiners reported production of 4.04 million ounces of refined bullion in 1975, 29% higher than in 1974, owing mainly to processing more scrap. Domestic ores and concentrates, including byproduct sludges, accounted for 27% of the output, and imported crude materials provided 6%. About two-thirds of production was from scrap, some of which was recycled several times during the year. Scrap refining activity was 40% higher than in 1974, partly because of efforts to reduce turnaround time and reduce inventory costs.

Gold refining operations at ASARCO Inc. east coast plants were phased down in 1975 in preparation for transfer of precious metal refining to a new plant at Amarillo, Tex. The new plant was expected to process less gold scrap than was formerly treated in the East. In early 1976 ASARCO announced the decision to discontinue refining at its Perth Amboy, N.J., plant. Gold refining at the Carteret, N.J., facilities of AMAX Inc., declined 14% in 1975 to 840,000 troy ounces. The company processes and refines gold mainly from scrap sources; some copper and other refinery sludges are also treated. Kennecott Copper Corp. refined 9% less ounces of gold than in 1974.

Homestake Mining Co. reported a 25% drop in income from the Homestake mine in South Dakota. A cave-in of a ventilation shaft and subsequent fire in the mine's exhaust air system reduced production. Gold bullion sales from the Homestake mine were valued at $55.16 million in 1975 compared with $47.93 million in 1974. The company's overall bullion sales were valued at $65.67 million compared with $59.80 million in 1974. Production totaled 304,877 ounces versus 343,650 ounces in 1974. The average recovered grade was 0.207 ounce per ton compared with 0.220 ounce per ton in 1974. A total of 1.47 million tons of ore was mined, 6% less than in 1974. Mill recovery was slightly higher in 1975 at 95.4% of the gold present in the ore. Ore reserves at the end of 1975 were reported at 15.26 million tons averaging 0.264 ounce per ton, mostly in proven and probable classifications. Efforts were directed toward developing additional ore in the 19 and 21 Ledges to compensate for declining reserves of high-grade Main Ledge ore. The lower grade 11 Ledge and marginal-grade upper level stopes contributed to lowered mill grade in 1975. Operating costs rose sharply in 1975 owing to higher labor and supply costs. Stope development was expanded and there were 105 active stopes at yearend. Development of blasthole stoping was expected to increase productivity. Construction was planned to start in early 1976 on the new $10 million Grizzly Gulch tailings dam and pumping system to handle mill wastes and reduce pollution in Whitewood Creek.

Gold production at the Carlin mine (includes the nearby Bootstrap and Blue Star mines) of the Carlin Gold Mining Co., owned by Newmont Mining Corp., in Eureka County, Nev., rose to 213,000 ounces compared with 160,500 ounces in 1974. Although the tonnage mined (ore and waste) declined 7%, the amount milled, 829,000 tons, was slightly greater and the ore grade at the mill was 0.292 ounce per ton, 31% higher than in 1974. Net income from the Carlin operation rose to $14.9 million compared with $10.9 million in 1974. The Bootstrap mine provided 57,000 tons of ore averaging 0.189 ounce per ton, and the Blue Star mine provided 51,500 tons averaging 0.147 ounce per ton. During 1975 stripping began of waste overlying 1.12 million tons of ore under the main Carlin pit. Substantial tonnages of highly carbonaceous ore requiring new metallurgical methods for treatment were reported at greater depth in the East Pit. Ore reserves were estimated at 5 million tons averaging 0.221 ounce per ton at the three mines, exclusive of the deep carbonaceous ore and about 0.5 million tons of 0.04-ounce-per-ton material at the Bootstrap and Blue Star properties.

Operations at the Cortez mine of Cortez Gold Mines in Lander County, Nev., were nearing an end, with ore reserves at both the main Cortez property and the nearby Gold Acres property almost exhausted. Leaching of ore in low-grade heaps was to continue until mid-1976, but milling was to terminate prior to that time. Average ore grade milled was down 30% in 1975 to 0.081 ounce per ton; 754,100 tons was milled, with recovery of 79% of the gold; 48,500 ounces of gold was produced by milling compared with 81,200 ounces in 1974, and 25,400 ounces was produced by leaching compared with 23,100 ounces in 1974. In addition, 14,300 ounces of silver was produced versus 17,200 ounces in 1974. Net earnings at Cortez in 1975 were $4.15 million compared with $9.3 million in 1974.

Production from the Gold Dollar lease of Day Mines, Inc. at Republic, Wash., was treated, together with other ores, by Knob Hill Mines, Inc., at its flotation-cyanide mill and amounted to 9,668 tons averaging 0.76 ounce per ton in gold and 3.42 ounces per ton in silver. Day Mines share of additional ores from the No. 3 joint operation (joint with Knob Hill Mines) was 7,253 tons averaging 0.3 ounce per ton in gold and 1.77 ounces per ton in silver. Reserves from these properties were expected to sustain two more years of production.

Alaska Gold Co. reported its No. 5 dredge operated for 117 days in 1975 near Nome, Alaska, handling 740,391 cubic yards of gravel and producing 7,791 ounces of gold. Operations began July 11, so only about two-thirds of the usual season was utilized. A second dredge, the No. 6, was being reequipped for another site near the airport at Nome. At Hogatza the company produced 3,360 ounces, operating from May 14 to October 17.

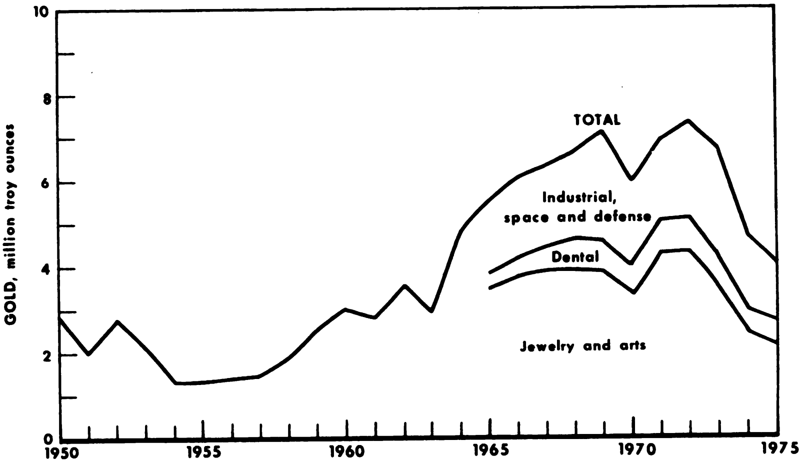
Golden Cycle Corp. reported an agreement to develop its properties at Cripple Creek, Colo., under a joint venture with Texasgulf Inc. Exploration conducted by Golden Cycle from 1972 through 1975 was said to have cost over $5 million. Smoky Valley Mining Co., a subsidiary of Copper Range Co., participating in a joint venture with Felmont Oil Corp. and Essex Royalty Corp., continued development of a large gold property at Round Mountain, Nev. First production was scheduled for late 1976 and the mine was expected to produce at a rate of 82,300 ounces per year for at least 5 years. Proven extractable ore reserves were estimated at 11.6 million tons averaging 0.06 ounce per ton. Open pit mining and heap leaching were planned. Facilities were reported half completed in 1975.

Azcon Corp. and Cyprus Mines Corp. joined in exploration projects at the Ortiz gold deposit near Cerrillos, N. Mex., where over 10 million tons of ore, grading about 0.05 ounce per ton was expected to be available to open pit mining, and at the Gold King mine, near Wenatchee, Wash, last operated in 1965. Ranchers Exploration & Development Corp. joined with Frontier Resources, Inc., and Marline Oil Corp. in exploring extensive gold-bearing placers in eastern Alaska. Drill results were being evaluated and reserves were believed to justify a mining operation.

CONSUMPTION AND USES

Domestic gold consumption, as measured by conversion of bullion into primary products, totaled 3.99 million ounces in 1975, 14% lower than in 1974. Consumption was divided, by estimated end use, as follows, in thousand ounces (with 1974 figures in parentheses): Jewelry and arts, 2,080 (2,402); dental, 595 (509); and in various industrial uses, mainly electronic, 1,059 (1,740). Jewelry and arts accounted for 52% of consumption; dental, 15%; industrial, 27%; and investment products, 6%. In addition to the usual consumption categories, gold was utilized in items for investment in 1975 for the first time following U.S. legalization of private ownership. A total of 258,000 ounces was reported consumed in the manufacture of fabricated bars and similar products designed mainly for investment buyers. About 45% of all gold consumption took place in the first half of the year. An estimated 66% of all gold went into karat gold products and bullion containing over 40% gold by weight; 16% was used in electroplated products, and the balance went into other forms of use such as rolled and gold-filled products.

U.S. buyers of gold products also purchased an estimated 1.7 million ounces of gold in the form of imported coins. This compared with the nearly 3.1 million ounces in coins imported for sale in 1974. Marketing of gold coins was at a slightly lower rate in the second half of 1975 than in the first half.



• Total also includes 1975 figure for investment of 0.3

Figure 2.—Gold consumption in the United States.

Continuing high prices for gold in 1975 encouraged jewelry and electronic manufacturers to reduce the gold content of their products. Consumers tended to be receptive to products containing less gold where it could be demonstrated that performance and appearance were not significantly affected. Electroplaters were under pressure to reduce costs, and plating formulations were modified to use less gold while maintaining or even increasing performance qualities. Palladium was substituted for gold in switches by several companies, rhodium was considered for substitution in contacts and switches where extra durability was needed. Reflective surfaces were attained in plating by addition of small amounts of silver or, in a newer practice, about 0.2% of cobalt.

Inlay-clad gold and gold alloys were prominent in the design of electronic and electrical connectors as a reliable alternative to electroplated gold. Clad metal technology permitted thin coatings of varying composition and hardness down to a range of 1.25 to 5 micrometers, approximately the thickness of some electrodeposited golds. Cladding alloys included various combinations of gold, nickel, silver, copper, platinum, cadmium, and indium. An inlay-clad product is prepared by cutting a groove in a base metal strip and emplacing a precious metal strip which was previously bonded to a nickel strip. Rolling causes a bonding of the total strip. Use of clad gold for certain components in military applications was approved for the first time by the Defense Electronics Supply Center, and it was believed that since many specifications are based on military standards the move would greatly expand the use of clad gold.[5] Connectors in clad gold generally were priced 10% to 15% below the price of plated connectors.

Jewelry makers substituted silver for gold. One manufacturer used an alloy of half 14 karat gold and half sterling silver in wedding bands retailing at a 40% reduction in price.[6] Class rings were made of an alloy of silver, palladium, nickel, chromium, and other metals to simulate traditional white gold at a significant cost reduction. Substitution of silver for gold went a step farther than that, with the substitution of an aluminum-based alloy for a pewter-like product, which competes with silver products. Sales of heavy gold-plated and gold-filled products were reported higher in 1975 owing to the expense of karat gold products.

Gold can be applied to a variety of surfaces including aluminum and stainless steel, and as a result, an important potential use in solar heat collectors has been proposed. Gold-bearing heat absorbers have functioned at temperatures up to 400° C, and have proven easier to work with than alternative materials. In trapping solar energy, a coating of gold and manganese dioxide is used, taking advantage of wavelength differentials between solar and thermal radiation to enhance collection efficiency. In effect the thin gold coating provides a transparent heat mirror, trapping the solar energy. Gold films are applied by vacuum deposition or sputtering in such thin coatings that the price of the gold is considered unimportant to the product cost.

STOCKS

Monetary.—U.S. Treasury gold stocks at the beginning of 1975 amounted to 275.98 million ounces valued at $11,652 million and declined during the year as a result of gold sales in January and June to 274.73 million ounces valued at $11,599 million. Monetary gold stocks remained officially valued at $42.22 per fine troy ounce. Treasury gold sales, however, were at market-related prices.

Earmarked gold held in Federal Reserve banks for foreign official accounts was valued at $16,745 million at the end of 1975, equivalent to 396.61 million ounces, 2.20 million ounces less than at the end of 1974. Gold went partly to exports and partly to domestic markets.

Total gold reserves of all central banks and governments (excepting those of centrally planned economies) were valued by the Federal Reserve Bank at $49,740 million at the end of 1975, $50 million less than at the end of 1974. Major countries or institutions holding stocks, with equivalent million ounces, at the end of 1975 were as follows: The United States, 274.7; IMF, 153.4; the Federal Republic of Germany, 117.6; France, 100.9; Switzerland, 83.2; Italy, 82.5; the Netherlands, 54.3; Belgium, 42.2; Portugal, 27.8; Canada, 22.0; Japan, 21.1; the United Kingdom, 21.0 (September); the Republic of South Africa, 17.7; and Spain, 14.3. World monetary stocks totaled 1,178.1 million troy ounces of gold compared with 1,179.3 million ounces at the end of 1974.

---

[6] Ward, A. All That Glitters Isn't Gold. Jeweler's Circ.-Keystone, March 1975, pp. 106–108.

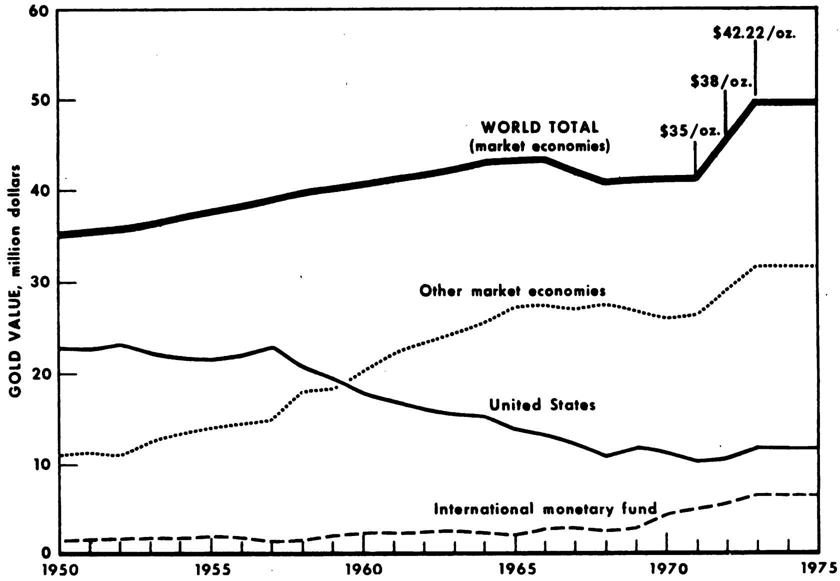

Figure 3.—World monetary gold stocks.

According to the IMF, world gold reserves in central banks (excluding international institutions and centrally planned economies) at yearend 1975 totaled 984.4 million ounces. Gold holdings were distributed in specified groupings (some overlap) as follows, in million ounces: Industrial countries, 824.3; other European countries, 50.8; Australia, New Zealand, the Republic of South Africa, 24.4; less developed areas, 85.0; oil exporting countries, 34.4; other Western Hemisphere countries, 17.2; other Middle East countries, 14.4; other Asian countries, 17.4; and other African countries, 1.6. The ratio of the value of gold reserves to overall money reserves reported for all countries was 1 to 5.48. Corresponding ratios by groupings were as follows: Industrial countries, 1:3.5; other European countries, 1:6.1; Australia, New Zealand, the Republic of South Africa, 1:4.8; less developed areas, 1:24.5; oil exporting countries, 1:40.0; other Western Hemisphere countries, 1:12.5; other Middle East countries, 1:8.7; other Asian countries, 1:17.7; and other African countries, 1:39.2.

Special Drawing Rights (SDR's) allocations, holdings, and quotas for all countries at the end of 1975 were, respectively, in millions: 9,314.8; 8,763.7; and 29,211.4. Each SDR was valued at an average rate of $1.21415 in 1975. Dollar values were based on changes in value of a "basket" of currencies of major trading countries. The U.S. gold position in the IMF was $2,212 million at the end of 1975 compared with $1,852 million a year earlier.

Industrial and Trading Stocks.—Data collected by the Bureau of Mines on industrial stocks of gold bullion 995 fine or better showed a drop of 1,108,000 ounces during 1975 to 788,000 ounces at yearend. Trading stocks which were estimated to amount to 550,000 ounces at yearend 1975, were held mainly by COMEX and IMM exchanges. Most of the same gold was registered to both exchanges, creating an overlap of data. Accumulation of trading stocks began shortly before the end of

1974 when firms began to prepare for gold trading. Gold placed in stocks had to meet grade specifications and other requirements. At yearend 1975 stocks registered and eligible to trading by COMEX were 403,237 ounces; stocks in the IMM totaled 531,421 ounces (includes all or most of COMEX stocks); and the Chicago Board of Trade held 19,097 ounces (partly also in IMM stocks). In addition there were minor stocks in the New York Mercantile Exchange and MidAmerica Commodity Exchange. The net result of declining industrial stocks and rising trade stocks was an estimated decline of 560,000 ounces in overall stocks.

PRICES

Gold prices, quoted daily by Engelhard Industries, began the year at $175.50 per troy ounce, rose to the high for the year of $185.75 on February 24, declined thereafter to the low of $129.25 on September 23, and ended the year at $140.75. Monthly averages showed a gradual decline from the high of $179.99 in February until August. From August to September the average dropped nearly $20, the fall attributed to an announcement on August 31, by the Interim Committee of IMF that there had been an agreement to sell 25 million ounces of gold at market related prices. From September to December prices gradually continued downward, with December averaging $139.80. The average for the year was $161.49 compared with $159.74 in 1974. London final prices were generally 50 cents less than Engelhard Industries prices, representing approximate transshipment costs, and averaged $161.02 in 1975. Through February 1976 there had been no announcement of a date for the pending IMF gold sales, and prices in early 1976 fluctuated close to $130. An official gold price of $42.22 per ounce remained in effect for valuing stocks of central banks; however, the IMF began action in 1975 to remove this official price, which it was said no longer appeared to serve a purpose.

Table 2.—U.S. monthly gold selling prices, per ounce

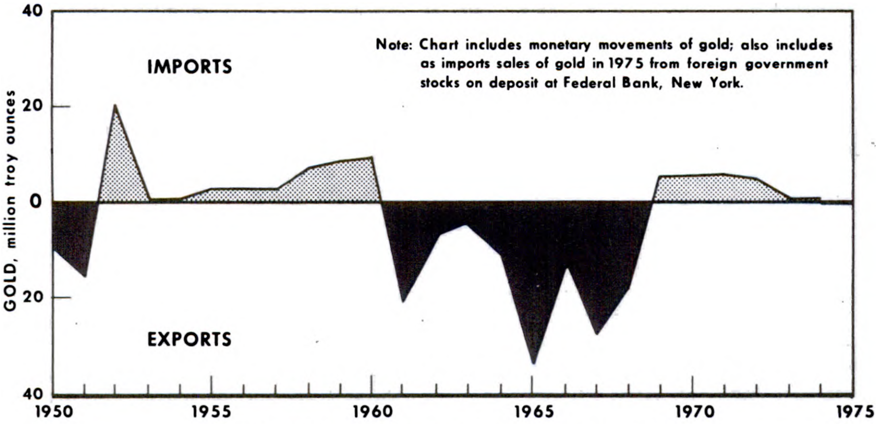
Month	1975		
	Average	Low	High
January	$176.77	$170.00	$180.75
February	179.99	173.90	185.75
March	178.58	176.75	182.35
April	170.34	164.50	177.75
May	167.89	164.00	175.25
June	164.74	162.25	166.75
July	165.71	163.00	168.90
August	163.45	160.30	167.25
September	144.07	129.25	153.75
October	148.26	139.40	146.75
November	143.27	139.75	146.40
December	139.80	137.75	142.90
Year	161.49	129.25	185.75

Source: Engelhard Industries.

FOREIGN TRADE

U.S. exports of gold in 1975 totaled 3.50 million ounces valued at $492.9 million. Of the amount exported, 807,138 ounces was monetary gold going to Singapore valued at the official rather than open market price. Exports of nonmonetary refined gold bullion amounted to 2.29 million ounces valued at $395.2 million. Destinations were mainly as follows, in million ounces: The United Kingdom, 1.34; West Germany, 0.42; Canada, 0.21; Switzerland, 0.17; and Mexico, 0.10. The balance of the gold exported consisted of scrap and base bullion amounting to 0.39 million ounces valued at $63.7 million, going mainly to Belgium (39%) and the United Kingdom (39%).

Imports of gold totaled 2.66 million ounces valued at $456.6 million and consisted of 0.31 million ounces of ore, scrap, and base bullion valued at $50 million and 2.35 million ounces of nonmonetary refined bullion valued at $406.6 million. Imports were 43% from Canada, 19% from Switzerland, 13% from the United Kingdom, 9% from France, and 16% from 40 other countries. Average valuations given for gold bullion imports from the leading sources, per troy ounce, were: Canada, $160.45; Switzerland, $184.95; the United Kingdom, $187.69; and France, $186.92. The overall average valuation was $173.09 per ounce. In addition to imports, gold markets were supplied with 0.58 million ounces of bullion from foreign government stocks stored at the Federal Reserve Bank in New York City.



Note: Chart includes monetary movements of gold; also includes as imports sales of gold in 1975 from foreign government stocks on deposit at Federal Bank, New York.

Figure 4.—Net exports or imports of gold.

The net inflow of gold to U.S. markets (excluding monetary movements but including supplies from foreign stocks in New York) amounted to 0.55 million ounces in 1975 compared with 4.23 million ounces in 1974. In addition an estimated 1.67 million ounces of gold was imported in the form of gold coins in 1975, 46% less than in 1974. Unrefined gold exports in the form of scrap and base bullion exceeded imports of ore, scrap, and base bullion by 81,000 ounces. The gold contained in the unrefined imports, amounting to 313,038 ounces, was 42% in ore and 58% in scrap and base bullion. Ores came from the Philippines (28%), Australia (25%), Canada (20%), Peru (13%), and 12 other countries (14%); scrap and base bullion came from Singapore (25%), Canada (22%), the Republic of South Africa (13%), West Germany (11%), and 30 other countries (29%).

WORLD REVIEW

A 3% drop in world gold production in 1975 was attributable mainly to continued declining production in the Republic of South Africa. Canadian and U.S. production also declined somewhat; significant increases were indicated in the U.S.S.R., up 3% according to estimates; in the Dominican Republic a new mine came into production. Copper production, an important source of byproduct gold in some countries, was lower in 1975 as a result of oversupply; thus, gold from byproduct producers was generally less than in 1974.

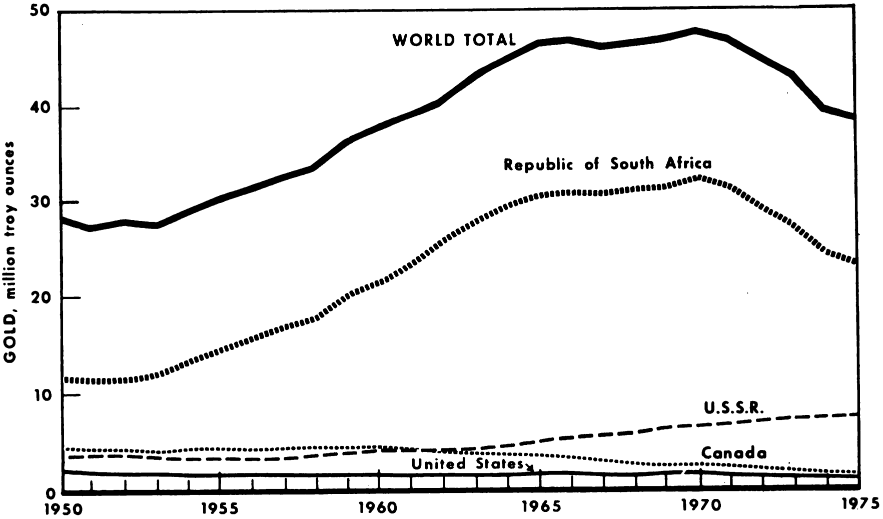


Figure 5.—World production of gold.

Consolidated Gold Fields Limited, in its annual world review, Gold 1976, estimated that the supply of gold to free markets fell 11% in 1975, and net bullion purchases for investment in 1975 amounted to 5.7 million ounces, one-fourth of the 1974 purchases for this purpose, indicative of a loss of investor interest in bullion. World gold demand for use in fabricated products showed a striking improvement in the second half of 1975, led by jewelry manufacture in developing countries. World supplies and net private purchases amounted to 36.2 million ounces, including 30.6 million from market economy country production, 4.8 million from centrally controlled economies, and 0.8 million from net official sales. It was estimated that 10% of production came from byproduct sources, mainly in the United States, Canada, the Philippines, and Papua-New Guinea. Net purchases (demand for gold) were broken down into the following categories (with 1974 figures for comparison in parentheses), in million ounces: Karat jewelry, 17.1 (7.4); electronics, 2.1 (3.1); dentistry, 2.1 (2.0); other industrial and decorative uses, 1.5 (1.9); medals, medallions, and counterfeit coins, 0.5 (0.2); official coins, 7.1 (9.2), and net private bullion purchases, 5.7 (16.7). Purchases for fabrication were also subdivided as follows, in million ounces: Developed countries, 22.0 (23.0); and developing countries, 8.5 (0.6). The leading countries in gold fabrication were, as follows with quantities in million ounces: The Republic of South Africa, 4.85 (mainly coinage); the United States, 3.82; Italy, 2.57; Japan, 2.42; West Germany, 1.82; Turkey, 1.77; the United Kingdom and Ireland, 1.49; Spain, 1.35; France, 1.10; Iran and Afghanistan, 0.90; and India, 0.84.

Gold used in official coins in 1975 was estimated to have increased 50% to 4.8 million ounces in the Republic of South Africa and 49% to 0.7 million ounces in the United Kingdom, but this use decreased 85% to 0.3 million ounces in Mexico, and 87% to 0.3 million ounces in Austria. Hungarian gold coinage dropped to nothing from 0.55 million ounces in 1974.

The Annual Bullion Review of Samuel Montagu & Co. Ltd. contained estimates of market supplies, as follows, in million ounces: New production, 30.2; U.S.S.R. sales, 4.5; and other sources, 2.9. Estimates of "offtake," also in million ounces, were: Europe, 14.8; the United States, 4.7; Far East, 5.1; Middle East, 3.2; rest of world, 2.7; investors, 7.1; for a total of 37.6. The total was 16% less than the estimate for 1974. Increases in gold jewelry purchases in the Far East and Middle East were notable during the year.

Following is a brief review of gold activities by country:

Australia.—Production declined in 1975 despite continued high gold prices. The Australia Industry Assistance Commission recommended phasing-out tax subsidies and concessions to gold mining and removal of restrictions on gold trading and on private ownership of gold. In early 1976 ownership restrictions were removed. Gold mining problems in Australia were discussed[7] and a report was published describing areas of gold occurrence in Australia.[8] A shortage of labor was evident in gold mining and costs were escalating. North Kalgurli Mines Ltd. suspended gold operations at Fimiston, Western Australia; Lake View and Star Ltd. stopped milling of custom ores at its plant. Western Mining Corp., operator of Gold Mines of Kalgoorlie (produced 87,394 ounces in the last half of 1974) considered closing its mines owing to higher costs and lack of government assistance. Western Mining conducted further exploration on the Queen Charlotte ore body and around the Kimbalda dome in Western Australia.

Newmont Proprietary Ltd. awarded Austin-Anderson (Australia) Pty. Ltd. a contract for construction of a $35 million open pit mine and milling facility at the Telfer gold deposit in the Paterson Range of Western Australia. Mining was planned to begin in 1977 at a rate of 1,200 tons per day. Reserves were estimated at 4.2 million tons averaging 0.28 ounce per ton. A 30% interest in the operation was acquired by Dampier Mining Co., Ltd., subsidiary of Broken Hill Pty. Co. Ltd. Inter Copper N.L. and Nobelex N.L. joined in developing the Lone Star gold and copper deposit at Tennant Creek in the Northern Territory. Also in the Northern Territory, Pancontinental Mining Ltd. and Getty Oil Development Ltd. began drilling the Jabiluka Two ore body where gold veins occur in the same area as uranium. Assays from a number of drillholes ranged from 0.2 to 5 ounces per ton over widths of 10 to 20 feet. At yearend Kalgoorlie Lake View Pty., Ltd., began closing its Fimiston gold mine, but signed a provisional agreement with Homestake Gold Ltd., subsidiary of Homestake Mining Co. (U.S.) for up to $8 million in financing for a 52% partnership to revive the gold operation.

Bénin (previously Dahomey).—New gold discoveries in Borgou Province of northernmost Bénin were reported as promising. Exploration was conducted by a group under the United Nations Office of Technical Cooperation.

Bolivia.—The Government called for foreign participation in a joint placer gold mining venture on the Kaka River, north of LaPaz. Values averaging 0.008 ounce of gold per cubic yard were reported in an area near Incahuara. South American Placers Inc. (U.S.) continued dredging gold on the Tipuani River and at the head of the Kaka River; upstream from the Tipuani dredges, El Camino Mines Ltd. (Canada) prepared to start placer operations in early 1976. A group of Bolivian companies test-drilled placer ground on the Upper Tuichi River.

Brazil.—Gold consumption in Brazilian industry was estimated at 0.51 million ounces in 1975, compared with production of about 0.25 million ounces. Owing to costs of importing gold, the Government attempted to encourage new gold production enterprises. A bucketline dredge was moved from the United States to Brazil in 1974 and was expected to be placed in service on a gold and diamond placer deposit of Dragagem Fluvial, S.A., partly owned by Hanna Mining Co. (U.S.). A potentially important gold lode discovery was reported in the Rondônia Territory near the Bolivian border. Gold Fields of South Africa Ltd. acquired stock in a Brazilian iron mining company, and the possibility was investigated to produce gold as a byproduct of iron mining at a new property.

British Solomon Islands.—On Guadalcanal, Solomon Islanders mined about 1,000 troy ounces of placer gold in 1975 at the Gold Ridge deposits.

Canada.—Canadian gold production declined about 1% in 1975, with lower outputs in Ontario, the Yukon, and British Columbia. Output by Province, in thousand ounces (with percent change from 1974 in parentheses), was Ontario, 747 (down 7%); Quebec, 433 (down 2%); Northwest Territories, 178 (down 3%); British Columbia, 155 (down 4%); Prairie Provinces, 67 (down 1%); Yukon, 21 (down 20%); and Atlantic Provinces, 20 (up 25%). Quartz lode and placer deposits contributed 75% of the total 1975 production and base metal mines the remainder. Placer mines accounted for less than 1% of production and were mainly active in the Yukon and British Columbia.

---

[7] Australian Mining. Gold Mining Has Problems. V. 67, No. 7, July 1975, pp. 6, 9.

[8] Liddy, J. C. The Gold Potential of Australia. Australian Min., v. 67, No. 7, July 1975, pp. 17–33.

In Ontario Campbell Red Lake Mines Ltd. milled 222,196 tons of ore, producing 139,990 fine ounces of gold in the first 9 months of 1975 versus 219,861 tons and 146,547 ounces of gold in the comparable period of 1974. Operating costs rose to $24.52 per ton of ore treated compared with $19.18 per ton in 1974. Operating profits were down 4% as a result. Dickenson Mines Ltd. reported tonnage down 13% to 69,268 tons milled in the first 9 months of 1975, but gold production was up 4% to 27,597 ounces. In the same period, Robin Red Lake Mines Ltd. produced 18,623 ounces of gold from 27,956 tons of ore. Dickenson ore reserves were 343,500 tons averaging 0.475 ounce per ton and Robin Red Lake reserves were 87,600 tons averaging 0.721 ounce per ton at the end of September 1975.

Cochenour Willans Gold Mines Ltd. planned to close its Red Lake mining operations as a result of escalating costs. A few thousand tons of low-grade material was milled and drilling had outlined about 200,000 tons of ore averaging 0.22 ounce per ton. Also at Red Lake, the Abino Gold Mines Ltd. property was explored by Dickenson Mines and a significant ore discovery was reported from drilling offshore in the lake bottom. Three drills were operating at the property late in the year and ore tonnage was estimated at over 700,000 tons. Bulora Corp.'s Madsen mine at Red Lake operated at 400 tons per day and was believed to have at least 2 years' reserves. Eastwood Resources Ltd., controlled by Bulora, explored a promising gold-silver deposit, the Berens River mine, 120 miles north of Red Lake.

Rengold Mines Ltd. began milling gold ore at its Renabie mine near Missanabie, Ontario, beginning at 300 tons per day. Ore reserves were estimated at 303,000 tons averaging 0.224 ounce per ton and additional ore was inferred. A promising high-grade gold-silver discovery was also reported by Rengold about 5 miles southwest of the Renabie mine, and trenching was underway to expose the ore body for sampling. A potentially large gold deposit was discovered by Amoco Canada Petroleum Ltd. at Detour Lakes, 130 miles north of Kirkland Lake and a few miles west of the Quebec boundary in northeastern Ontario. By yearend 1975, 100,000 feet of core drilling was expected to be completed. Reserves on the order of 5 million tons or more averaging about 0.2 ounce per ton were estimated, based on partial results. The ore body, covered with 25 to 125 feet of overburden was discovered by geophysical surveys and followup drilling.

At Brampton, a few miles west of Toronto, Ontario, Johnson, Matthey & Mallory Ltd. was completing a new $5 million precious metals refinery, which was scheduled to open in April 1976.

In Quebec the new mine and mill of Agnico-Eagle Mines Ltd. produced at a rate of 900 to 1,000 tons per day by yearend 1975, after correcting initial milling problems, and expansion to 1,200 tons per day was underway. In the first half of the year 29,029 ounces of gold was produced from ores averaging 0.236 ounce per ton. Ore reserves were estimated at 2.6 million tons averaging 0.29 ounce per ton, promising 8 years of operation. Goldex Mines Ltd. had disappointing results on an 8,000-ton test run from its Dubuisson Township, Val d'Or area mine, but planned additional test shipments. East Malartic Mines Ltd. operated its mill at about 1,600 tons per day in 1975. Teck Corp. Ltd. reported a gold discovery at its property on the Bourlamaque Batholith, near Val d'Or. Camflo Mines, Limited having completed expansion of its mill from 1,000 to 1,250 tons per day, milled 342,578 tons in the first 9 months of 1975, producing 66,148 ounces of bullion. Average production costs were significantly higher than the $46.70 per ounce reported in 1974. Sigma Mines (Quebec) Ltd. milled 367,414 tons of ore in the first 9 months of 1975, producing 53,443 ounces of gold, and for the period, operating costs were $14.82 per ton versus $13.06 per ton for the corresponding period in 1974. Ore reserves were estimated at 1.25 million tons. Construction of a 1,000-ton-per-day cyanide gold mill was well along at Quebec Sturgeon River Mines Ltd.'s Bachelor Lake mines, where reserves totaled nearly 1 million tons averaging 0.195 ounce per ton. The company also was developing a gold property near Timmins, Ontario.

A number of companies were active in the Val d'Or-Noranda gold belt. Belmoral Mines Ltd. used geophysical instruments and drilling to outline an estimated 0.5

million tons of ore averaging 0.2 ounce per ton in Bourlamaque and Senneville Townships in the Val d'Or area. Thompson Bousquets Gold Mines Ltd. investigated a large low-grade gold property (2 million tons, 0.07 ounce per ton) in Bousquet Township and made a 15,000-ton test shipment to a custom mill. Pending higher gold prices, Noranda Mines Limited suspended its work at Dumagami Mines Ltd. in Bousquet Township where 2.5 million tons of ore averaging 0.095 ounce per ton was developed. Selco Mining Corp. continued exploration at its Detour mine in Brouillan Township northwestern Quebec, where 35.4 million tons of ore was estimated to contain 0.39% copper, 2.3% zinc, 1.04 ounces of silver per ton and 0.009 ounce of gold per ton. The Chibex gold mine, a new $13 million venture of Chibex Ltd. at Chibougamau, Quebec, was inoperative owing to poor metallurgical recovery—50% versus an expected 90%. Additional funds were sought to correct milling deficiencies.

In the Bathurst area of New Brunswick, Zarina Explorations Ltd. explored a rich gold-silver-lead deposit in the Millstream River area, 12 miles northeast of Bathurst. Claymore Resources reported rich placer gold results at its claims in the Gold Range district of the Yukon bordering Alaska, 250 miles northwest of Whitehorse. Drilling was continued at yearend. In British Columbia Caroline Mines Ltd. sought financing to develop its Ladner Creek property containing an estimated 1.5 million tons of gold ore averaging 0.14 ounce per ton. Feasibility studies on the project were to be completed by mid-1977. British Columbia passed a new Placer Mining Act effective June 2, 1975, making it easier to obtain placer mining rights. Placer mining was active at Atlin, British Columbia, and several locations nearby. Canex Placer Ltd. was expected to begin exploration of the Nevex Mines Ltd. Hag Group gold-copper property, 23 miles east of Osoyoos, British Columbia. Cominco, Ltd. began work on the second phase of a $17 million expansion of its Con gold mine at Yellowknife, in the Northwest Territories. Capacity was to be expanded from 450 to 1,100 tons of ore per day by the program. Ores generally graded 0.5 to 0.7 ounce per ton at the Con mine. Terra Mining and Exploration Ltd. negotiated for a production lease on gold properties at Buckham Lake, 53 miles southeast of Yellowknife, Northwest Territories.

Colombia.—The Government began paying market-related prices to gold producers for their output, spurring additional production. The Government also created a special loan fund for miners and assisted in financing Colombia's first gold reduction plant near Ibaque, central Colombia. Mine production was expected to reach 340,000 ounces in 1975, based on the first half-year results. The municipality of Condoto, Department of Chocó, refused permission to Mineros Colombianos, S.A., to dredge gold upstream from town, owing to possible environmental damage and displacement of a number of individual miners, who had questionable claims to the ground they were working.

Congo, Republic of.—A large gold discovery by a U.S.S.R. exploration team was reported at Kalmoueko, 250 miles north of Pointe Noire.

Costa Rica.—Hearne De Costa Rica, S.A., tested soil samples from its Miramar gold property, a former producer, and planned rehabilitation. Other properties, the Santa Clara and Mina Recio, were optioned to a Canadian firm, which conducted new exploration on several ore zones, one containing an indicated reserve of 750,000 tons averaging 0.1 ounce per ton available to open pit mining.

Dominican Republic.—Rosario Dominicana, S.A., began production in April at its Pueblo Viejo gold-silver mine and by yearend was operating at nearly full capacity (350,000 ounces of gold per year). The 1975 production totaled 195,941 ounces of gold and 109,465 ounces of silver from 1.7 million tons of ore grading 0.12 ounce of gold and 0.13 ounce of silver per ton. Developments were described in several publications.[9] Operating costs were expected to be $50 per ounce of gold. An increase in milling capacity from 8,000 to 10,000 tons of ore per day was under consideration. The company applied to the Government to convert the adjoining Los Cacaos exploration concession to a mining concession after developing a substantial tonnage of additional oxide gold-silver ore reserves. The Government, however, insisted on renegotiation of its agreements with Rosario and a decision was delayed.

---

[9] Argall, G. O., Jr. How Rosario Dominicana Discovered and Mines Microscopic Gold Ore. World Min., v. 28, No. 10, September 1975, pp. 36–42.

Brown, B. D. Columbus' Gold Mine Reopened By Rosario Resources. The Stock Market Magazine, v. 14, No. 7, August 1975, pp. 4–8.

El Salvador.—Bruneau Mining Corp., controlled by Rosario Resources Corporation, explored the El Dorado gold property, last operated about 1953. Extensive geochemical sampling was included. Canadian Javelin Ltd. reopened the Los Encuentros gold and silver mine, processing ores at the Minas San Cristobal mill and refinery. Output in 1975 was expected to reach about 75,000 tons averaging 0.09 ounce of gold and 5 ounces of silver per ton.

Ghana.—A new shaft was started at the Ashanti gold mine at Obuasi to provide an additional 55,000 ton-per-month hoisting capacity. The shaft is planned for 7,000 feet and is expected to handle 4 million tons during the estimated 15-year life of the mine.

Greece.—Greek Gold Mines S.A. and Masivor Corp. (Canada) began developing the first of three gold placer mines at Servia, Kozani. Proven reserves were estimated between 15 and 20 million cubic yards with values from 0.02 to 0.03 ounce per yard. A large additional yardage was inferred.

Hong Kong.—The Chinese Gold and Silver Exchange announced plans to invite overseas participation in trading and to convert to the troy ounce from the tael as a trade unit.

Honduras.—Gold mining possibilities in Honduras were assessed and a map of favorable areas was presented.[10] The Government approved a mining lease to Alianza Industrial, S.A., subsidiary of NRD Mining Ltd. (Canada), covering the Tatumbla open pit deposit containing an estimated 225,000 tons of ore grading 0.2 ounce in gold and 0.5 ounce in silver per ton. Rosario Resources Corporation planned to expand its El Mochito gold-silver mine output from 300,000 to 460,000 tons of ore per year by 1978.

Indonesia.—Recorded output of gold bullion was all from the State Mining Company, P.N. Aneka Tambang, and nearly all was from the Tjikotok gold-silver mine in West Java. Small amounts of placer gold were also produced by individual panners in Sumatra, Kalimantan, and northern Sulawesi. Indonesian law prohibited gold exports, and a 30% duty applied to imports, hence, smuggling was on the rise. Gold was also produced in copper concentrates from operations in West Irian, amounting to 53,158 ounces in 1974 and probably more in 1975. Concentrates containing about 0.25 ounce per ton in gold were exported to Japan for smelting and refining. New areas being explored for gold were in Logas, Central Sumatra; Northern Sulawesi; the Bengkulu area of West Sumatra; near Cianjur, West Java; in Kapuas, Central Kalimantan; at Gunung Mas, Central Kalimantan; and in the Mahakam Valley of East Kalimantan.

Mali.—The Mali Government signed an agreement with the U.S.S.R. for production of gold at the Kalna mine. Production on the order of 50,000 ounces per year was envisaged.

Mexico.—Four silver-gold mines in Guanajuato, being developed by Minera Las Torres S.A., were expected to produce at a rate of 50,000 ounces of gold annually in addition to 7 million ounces of silver beginning in 1976. A 2,000-ton-per-day mill was scheduled to begin operation in early 1976.

New Zealand.—The Kaniere gold dredge, operating on the west coast of New Zealand's South Island, produced 98% of the country's gold output.[11] It was planned to move the dredge to the Grey River soon when the current area is worked out.

Nicaragua.—Rosario Resources Corporation treated gold-silver ore by flotation at its Rosita property and stockpiled tailings for reprocessing when installation of a cyanide circuit was completed.

Pakistan.—A project was underway by the Pakistan Mineral Development Corp. to target gold placer areas for prospecting in the upper reaches of the Indus Valley. Tests on a large number of borehole samples were due for completion by yearend 1975.

Panama.—Tuquesa Mining, S.A., received a 15-year permit from the Government for exploitation of placer gold deposits in Darien Province. The company had completed a 5-year, $0.5 million exploration program, in which 150 million cubic yards of placer material averaging about $2 per yard were estimated to be available. The site is in a dense jungle accessible only by air. Negotiations were being conducted for purchase of suction dredges and heavy mining equipment. Another large tract was opened for prospecting in the same region.

[10] Svanholm, J. Gold in Honduras—Where to Look For and Find It. World Min., v. 28, No. 6, June 1975, 30–31, 61.

[11] Australian Mining. Gold Mining in N.Z. V. 67, No. 7, July 1975, pp. 39–40.

Peru.—Placer gold made up 31% of the 1974 gold production.

Philippines.—Gold production declined 6% to 501,776 ounces in 1975, with much of the drop late in the year. This was despite the reported entry of 7 new gold mines into operation adding to 11 existing ones. The Government offered a number of incentives to gold mining, and producers were allowed to sell gold to authorized dealers to obtain 100% loans to finance operations.[12] The Agusan gold mine was active,[13] and Atlas Consolidated Mining & Development Corp. planned to reopen the Masbate open pit gold mine at Rio Guinobatan, Masbate Island, reportedly having 6 million tons of reserves assaying 0.08 to 0.10 ounce per ton in gold.[14] The project was expected to cost about $10 million.

Consolidated Gold Fields Limited signed a contract for 40% participation in a gold project in Nueva Vizcaya, Luzon, where an estimated 16.5 million tons of low-grade ore will supply an output of 150,000 ounces of gold per year. Metals Exploration Asia Ltd. explored the Longos prospect in Paracale having estimated reserves of 600,000 tons averaging 0.55 ounce per ton and considered a 200,000-ton-per-year operation. Johnson Matthey & Co., Ltd. (U.K.) signed a contract with the Central Bank of the Philippines to supervise construction of a precious metals refinery at Quezon, east of Manila. Capacity of the plant will be 600,000 ounces of gold and 450,000 ounces of silver annually.

Rhodesia, Southern.—Rio Tinto (Rhodesia) Ltd. purchased the Renco gold-copper mine near Fort Victoria and on the basis of estimated underground reserves planned a 10-year mining venture. Grandeur Gold Mining Co. Ltd. planned to produce in 1976 after discovering gold at Grandeur Ranch Estates, 35 miles from Gatoona. Proven reserves were 182,000 tons averaging 0.25 ounce per ton; milling was planned at 3,000 tons per month.

Sierra Leone.—Renewed interest was indicated in Sierra Leone gold deposits, where placers were mined in the 1930's; a prospecting license was granted to Diamond Distributors, Inc. (U.S.).

Sikkim.—Sikkim Mining Ltd. reported discovery of a 2-million-ton deposit grading 0.32 ounce of gold and 2 ounces of silver per ton at the Kitchu copper property, between the eastern border of Nepal and southern Tibetan border. Construction of a smelter and refinery were considered.

South Africa, Republic of.—Gold production declined for the fifth consecutive year, down 6% compared with the 1974 output. Ore production totaled about 74.5 million tons, with grade averaging 9.51 grams per ton (0.28 ounce per short ton). The average grade was 30% below that of 1970, when gold prices began rising, while the tonnage mined was the same. Working costs rose sharply during 1975. At mines of the Anglo-American Group, costs rose 22% during the year ending in September 1975. A major factor was labor costs which rose nearly 40%.

A September devaluation in the South African rand, amounting to 17.9%, increased the rand payments to gold producers but made it more costly to import supplies and equipment needed from abroad. As a result of inflationary trends, working costs were expected to rise 15% to 25% in 1976. However, the supply of miners was expected to ease, with improvement in recruiting and a decline in labor disputes; the trends favored increased tonnages from many mines, although a further decline in the average ore grade was expected. Several mill expansion projects, due for completion in 1976, should add to tonnages treated.

The seven large gold producing groups reported the following outputs in 1975 (in million ounces, with 1974 outputs in parentheses): Anglo American Corp. of South Africa, Ltd., 9.16 (9.65); Gold Fields of South Africa Ltd., 4.34 (5.02); Rand Mines Ltd., 2.57 (2.80); Union Corp., 2.38 (2.51); General Mining & Finance Corp., 1.70 (1.86); Anglo Transvaal Consolidated Investment Co. Ltd., 1.38 (1.48); and Johannesburg Consolidated Investment Corp., 1.09 (0.96). The seven accounted for about 99% of South African gold production. A total of 39 gold mines was represented by these groups. Eight of the mines also reported production of uranium as a byproduct or coproduct. The largest of these was the

Vaal Reefs, followed by the Harmony, Buffelsfontein, and Hartebeestfontein mines.

Three new mines were scheduled for production by 1981 or earlier. Union Corp. planned to open its Unisel mine on the Jurgenshof farm, Orange Free State, in September 1978. Using longwall stoping for mining, the property was to produce 75,000 tons per month, yielding 0.41 ounce per ton in gold. Ore reserves were estimated at 14.5 million tons. Gold Fields of South Africa planned to start production at its Deelkraal mine in 1980 and extract ore averaging 0.33 ounce per ton at a rate of 60,000 tons per month initially, increasing to 140,000 tons per month by 1983. By yearend two shafts had progressed to about 1,000 feet below the collars. Ore reserves were estimated at 45 million tons. At Anglo American Corp.'s Elandsrand mine, on the Buffelsdoorn farm northeast of the Deelkraal mine, initial shaft sinking reached depths of about 800 and 500 feet on two shafts, one for men and material and the other for ventilation and hoisting ore and rock. The mine was scheduled to begin production in 1981 and ultimately produce at a rate of 150,000 to 170,000 tons per month.

South Africa's proven ore reserves at the first of the year were reported at 287.7 million tons ("fully developed and blocked out") averaging 0.364 ounce of gold per ton. Exploration was accelerated in 1975 to the highest levels ever recorded. Over 500 surface and underground drills were operated and airborne geophysical surveys were conducted over many areas. Blyvooruitzicht Gold Mining Co., Ltd., reported finding rich intersections with the Main Reef in the western portion of its mine near the No. 2 shaft. Free State Saaiplaas Gold Mining Co. Ltd. began shaft sinking at its mine in the Orange Free State in a program to expand capacity from 1.2 to 2.4 million tons per year by 1979. The shaft was to go 7,380 feet deep. Also in the Orange Free State, Free State Geduld Mines Ltd. was expanding capacity from 200,000 to 237,000 tons per month. Randfontein Estates Gold Mining Co., Ltd., announced a major expansion to increase capacity from 73,000 to 250,000 tons per month by 1979. About half of the company's capital expenditures went into development in the Cooke section, with emphasis on completion of the No. 2 shaft. Expansion included provision for a new integrated gold and uranium facility. Freddies Consolidated Mines Ltd., upon being acquired by Free State Geduld Mines Ltd. of the Anglo American group, was to expand mill operations from 59,000 to 88,000 tons per month. Loraine Gold Mines Ltd. announced it would proceed with a $40 million expansion to raise its milling rate from 104,000 to 200,000 tons per month by 1979.

The Western Areas mine, which merged operations with the Elsburg mine in 1974, increased milling rates from 300,000 to 390,000 tons per month, was expanding its gold treatment units, and planned to begin sinking a third shaft in the Elsburg section. The East Driefontein mine was expected to reach capacity operation of 180,000 tons per month by the end of 1976.[15] Three reef systems were mined, the Ventersdorp Contact, the Carbon Leader, and the Main Reef, extending in the mine from 3,200 feet deep in the north to nearly 13,000 feet in the south. Quantities milled in 1975 totaled 1.46 million tons averaging 0.56 ounce per ton. Anglo American Corp. of South Africa, Ltd. planned a $115 million facility to retreat old mill tailings on the East Rand near Johannesburg to recover gold, pyrite, and uranium. The plant, to be commissioned in 1978, was scheduled to treat 1.5 million tons of tailings per month and to have an operating life of 20 years. Products would include annually 200,000 ounces of gold, 400,000 pounds of uranium oxide, 300,000 tons of sulfuric acid, and 140,000 tons of pyrite. Processing will involve flotation, roasting, acid treatment of uranium, and cyanidation of gold.

United Kingdom.—Beginning April 15, 1975, the British Government restricted the import of gold coins and medals to dealers only and prohibited the purchase of new gold coins by British citizens. Citizens were prohibited, also, under the new regulations from buying British-minted gold sovereigns having a 1974 date. The restrictions were imposed to stem the outflow of foreign exchange for gold.

U.S.S.R.—Gold sales to other countries were estimated by industry sources at 4.5 to 4.8 million ounces in 1975 compared with 7.1 to 7.3 million ounces in 1974.

---

[15] Mining Magazine (London). East Driefontein Building Up to Capacity. V. 28, No. 5, May 1975, pp. 373–374.

The U.S.S.R. issued a 10-ruble gold coin called the Chervonetz, containing about 0.25 ounce of fine gold, and during the year produced about 250,000 units, of which an estimated 50,000 were shipped to the United States for sale. Soviet citizens were not allowed to own the coins, so the status as legal tender was questionable.

Zambia.—Gold production was scheduled to begin before yearend at the Luiri mine (formerly the Dunrobin), near Mumbwa, west of Lusaka. The mine was owned by Zambian Mindeco Small Mines Ltd.

TECHNOLOGY

Bureau of Mines research on gold recovery methods centered on leaching techniques as the best approach to extraction from low-grade ores. The Bureau's Reno Metallurgy Research Center assembled a trailer-mounted demonstration unit to perform field tests at active gold mines using newly developed methods of gold extraction. One method employed alkaline alcohol solutions to strip gold from the activated carbon used to collect gold from cyanide solutions.[16] Using a 10% to 20% methanol or ethanol additive to the conventional hot caustic cyanide strip solutions achieved much more rapid and complete gold and silver removal. A patent was issued on the hot caustic method by which gold-loaded carbon is contacted with a solution of sodium hydroxide and sodium cyanide at temperatures of 150° C to 165° C to dissolve the gold.[17] Relatively small amounts of solution are required and the resulting concentration is high.

Also to be demonstrated in the Bureau's mobile unit is a new procedure for separating silver from gold solutions. By removing silver in a simple precipitation step, gold of much higher purity can be produced at the millsite. A sodium sulfide precipitation/carbon adsorption method was shown to be an effective means of recovering silver and gold separately from cyanide solutions. An important advantage was that the technique greatly reduces the amount of activated carbon required for processing solutions relatively rich in silver. The process was adopted on a commercial scale by the Toulon Milling and Mining Co. in Nevada.

Other work at the Reno station included successful application of an electrooxidation technique to treat a gold telluride concentrate containing 52 ounces of gold per ton. Gold extraction was 94.6% and the electrical energy consumption was 168 kilowatt hours per ton of concentrate. The technique was also applied to a carbonaceous ore containing 0.14 ounce of gold per ton, but achieved only about 50% extraction with similar energy applied. The cell used was airlift bipolar, with four electrodes suspended in a 30% pulp density-10% sodium chloride ore slurry. Electrolysis pretreatment of samples of carbonaceous gold ores from Montana using a larger flow-through cell showed a 7% to 18% increase in gold extraction over conventional cyanidation utilizing 23 to 56 kilowatt hours per ton. Work was also conducted at the Reno facility on extracting byproducts in black sands from placer gold mining operations in northern California.

The Salt Lake City Metallurgy Research Center worked with the Defense Disposal Agency, Ogden, Utah, and Battle Creek, Mich. to assist that agency in precious metal scrap handling. Electronic scrap was evaluated and analyzed. Some results, in ounces of gold per ton, were connectors, 7 to 374; circuit boards, 37; circuit frames, 149 (242 stripped).

Small scale carbon-in-pulp cyanidation tests, simulated heap leaching, and other amenability tests were conducted on ores from a number of mines in the Western States. A 97.3% overall recovery was achieved from one ore grading 0.35 ounce of gold per ton using the carbon-in-pulp method. Research on a refractory ore from the Mercur district in Utah showed that better recovery was obtained by cyaniding ore composites than was indicated by individual sample tests, apparently owing to interaction or better distribution of arsenic, carbon, and other impurities. The gold recovery was increased 10% or more; overall recovery, however, was only on the order of 80%, owing to problem elements. Column cyanidation tests showed that two-thirds of the gold in a heap leach operation in California, with ore grading 0.07 ounce per ton and crushed to ½-inch size, could be extracted in about 30 days. Low-cost refining methods for gold and silver, adaptable to a small- to medium-size mine operation, were considered as a subject of new research.

Cyanide disposal problems were discussed at the September 1975 meeting of the American Institute of Mining, Metallurgical, and Petroleum Engineers at Salt Lake City, Utah. Titles of papers presented were as follows: Toxic Pollutant Effluent Standards; Description Rationale and Compliance Procedures; Design of Impoundment and Evaporation Ponds and Embankments for Cyanide and Other Toxic Effluents; the Chemical Basis of Techniques for the Decomposition and Removal of Cyanides; Chemical Oxidation of Cyanide Species by Ozone with Irradiation from Ultraviolet Light; and Cyanide Disposal at Homestake Mines. At the same meeting a report was given on the geology and geochemistry of the Getchell disseminated gold deposit, Humboldt County, Nev.

A successful heap leach gold cyanidation operation was established during the year at a New Mexico site near Albuquerque.[18] A list of major equipment and a cost summary were provided. Use of a fluidized bed reactor for roasting ore and special procedures with graphitic gold ores were described in a report on a large Canadian gold cyanidation and flotation mill.[19] Technical details on the construction and operation of a new gold mine and milling facility in the Dominican Republic were revealed.[20] The mill uses countercurrent decantation and has semiautogenous grinding, with capacity of 8,000 tons per day.

Advantages of the fire assay for gold and silver over other techniques of analysis were discussed, and procedures were described.[21] Reclamation of gold mine tailings was the subject of a report describing how to rehabilitate a tailings area.[22] Gold-dissolving bacteria, capable of dissolving up to 2.15 milligrams of gold per liter of solution in 2 to 3 months, have been discovered.[23] Gold was also recovered from an acid solution using mold fungi.

Equipment for high-capacity gravity separation, suitable for alluvial gold treatment, was described.[24] Testing of equipment was underway which would monitor particle size in milling at the Welkom mine, Orange Free State, Republic of South Africa, and which was expected to increase gold recovery about 0.4%.[25] Particle size control within 1% was said to be possible.

In mining, the Welkom mine was able to speed up underground tunneling, using jumbo drill rigs operating from both ends of a 1.3 mile haulageway, completing the work in 16 months.[26] At the Libanon gold mine, also in the Republic of South Africa, a full face tunnel boring machine was used for the first time to cut an 11-foot-diameter opening (raise borers had been used in raising since 1968).[27] An armored conveyor with integral blast screen, designed for use in a typical South African gold mine, was said to be capable of clearing blasted rock along a 130-foot face in 1 hour.[28]

A method of eliminating blasting in ore extraction from South African gold mines made some progress during the year. Several articles were published describing experimental machines which cut slots in a gold bearing quartz conglomerate "reef," reducing the amount of waste taken in mining the thin ore zone.[29] Boring of closely spaced holes along the reef as a means of extraction was another technique studied.

A new design for a movable shaft sinking head frame utilizing a "floating raft" was used at a South African gold mine.[30] Development plans, technical details, and cost breakdowns were given for the new Elandsrand mine, expected to come into operation in 1981 near Carletonville, South Africa.[31]

New evidence was developed appearing to confirm the role of well-differentiated Precambrian plant life in gold deposition in the Witwatersrand area of South Africa.[32] A series of excellent photographs document the evidence of bacteria, algae, fungi, and lichenlike plants associated with the gold. At a mine in Japan, conditions leading to deposition of gold in a typical epithermal deposit were established.[33] Gold was believed to be transported as gold-sulfur complexes rather than gold-chloride complexes and precipitation was mainly caused by an oxidation process.

A company in Providence, R.I., reported development of an ion exchange method using a coiled plastic tube filled with resins to extract gold, silver, rhodium, and other metals from plating solutions.[34] Improvements were described in flotation of pyrite containing gold values in South Africa.[35]

Patents were issued on processes of solvent extraction of gold using propylene or ethylene carbonate,[36] aqua regia separation of gold from platinum-group metals,[37] and production of high-purity gold powder from a cyanide plant precipitate.[38]

An evaluation was made of sources and processes for secondary precious metals recovery, and types of equipment used in smelting and refining were described.[39] The quarterly series of the Chamber of Mines of South Africa contained a variety of articles on new gold uses and technology.[40]

Papua New Guinea [6]	[e] 643,000	692,636	592,178
Total	43,296,755	39,941,080	38,574,162

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Unless otherwise indicated, production is on the basis of mine output.

[2] Gold is also produced in Bulgaria and Czechoslovakia, and probably in small quantities in Argentina, Panama, Burma, East Germany, Hungary, Thailand, and several other countries. However, available data are insufficient to make reliable output estimates. Data are lacking on clandestine activities.

[3] Figure reported as fine gold (i.e. almost pure).

[4] Figure reported as refined metal.

[5] Refinery production for Japan was as follows: 1973—1,052,775 ounces; 1974—1,123,474 ounces; 1975—1,043,775 ounces.

[6] Bougainville Copper Ltd. produced the following amounts: 1973—634,558 ounces; 1974—683,974 ounces; 1975—584,178 ounces. In addition, New Guinea produced the following amounts: 1973—[e] 8,000 ounces; 1974—8,662 ounces; 1975—[e] 8,000.

Graphite

By W. Timothy Adams [1]

Crystalline natural graphite was more available in 1975 as consumption decreased. However, the price of flake increased an average of 43% for all types and grades. Supplies of Mexican amorphous graphite were sufficient.

Imports of natural crystalline graphite from the Malagasy Republic increased slightly, and amorphous graphite imports decreased 36%. Exports of natural graphite decreased 13% to 10,586 tons.

Production of manufactured graphite decreased 22%. Expansion of facilities previously announced by several producers has been slowed because of decreased demand.

Table 1.—Salient natural graphite statistics

	1971	1972	1973	1974	1975
United States:					
Consumption [e] [1] short tons	60,000	70,000	79,000	94,867	70,000
Exports do	5,733	7,289	7,953	12,189	10,586
Value thousands	$680	$888	$992	$1,693	$1,890
Imports for consumption [2] short tons	57,756	64,135	77,431	82,636	65,663
Value thousands	$2,727	$3,847	[r] $4,494	$5,677	$5,698
World: Production short tons	433,925	[r] 397,894	[r] 435,150	[r] 541,085	484,942

[e] Estimate. [r] Revised.

[1] Estimated demand has been substituted for the consumption survey results previously published, since the latter are incomplete. A figure comparable to the previous series appears as the total of table 4.

[2] Includes some manufactured graphite.

Legislation and Government Programs.—As part of an effort to reduce strategic stockpile inventories, more than 50% of the natural graphite in the stockpile was declared excess by the General Services Administration (GSA). For strategic stockpile materials, congressional authorization is required before disposal. Of the three types of stockpiled graphite, about 50% of the Malagasy crystalline flake and Sri Lanka lump and chip and all of the crystalline flake other than Malagasy flake were placed on the excess list. Congressional authorization for this disposal was not obtained and no sales were made. However, all stockpiled graphite that had previously been authorized for disposal was sold and shipped. Removal of the import duty on crystalline flake graphite for a trial period of 3 years was requested.

DOMESTIC PRODUCTION

In 1975, natural graphite production in the United States was again from a single location, the Southwestern Graphite Co. near Burnet, Tex. Shipments from the mine were approximately the same as in 1974, and continued to account for only a small portion of the domestic supply. Other graphite deposits in Alabama, New York, Texas, and the Province of Saskatchewan, Canada, continued to arouse the interest of investigators contemplating the development or redevelopment of additional mines. However, no mine openings had occurred by yearend.

Reported production of manufactured graphite products decreased in 1975. Output of 250,443 tons was down 22% from the 322,513 tons reported in 1974. Total value of production increased 10% to $307.6 million from $280.1 million in 1974. The production of powder and scrap is estimated to have decreased to 27,589 tons valued at $1.8 million in 1975.

Manufactured graphite was produced at 25 plants in 1975, and some additional production for inhouse use was likely. The following is a list of principal producers in 1975:

Company	Plant Location
Airco, Inc., Speer Div	Niagara Falls, N.Y.
Do	Punxsutawney, Pa.
Do	St. Marys, Pa.
Avco Corp., Avco Systems Div	Lowell, Mass.
The Carborundum Co., Graphite Products Div	Hickman, Ky.
Do	Sanborn, N.Y.
Celanese Corp., Celanese Research Lab	Summit, N.J.
Fiber Materials, Inc	Graniteville, Mass.
Great Lakes Carbon Corp	Rosamond, Calif.
Do	Niagara Falls, N.Y.
Do	Morganton, N.C.
Hercules, Inc	Bacchus, Utah.
HITCO	Gardena, Calif.
Morganite Modmor, Inc	Costa Mesa, Calif.
Ohio Carbon Co	Cleveland, Ohio.
Pfizer, Inc., Minerals Pigments & Metals Div	Easton, Pa.
Poco Graphite, Inc	Decatur, Tex.
Polycarbon, Inc	North Hollywood, Calif.
Stackpole Carbon Co	Lowell, Mass.
Do	St. Marys, Pa.
Super Temp Co	Santa Fe Springs, Calif.
Union Carbide Corp	Niagara Falls, N.Y.
Do	Yabucoa, P.R.
Do	Columbia, Tenn.
Wickes Engineered Materials	Saginaw, Mich.

Expansion of manufactured graphite facilities listed in the 1974 Minerals Yearbook chapter was delayed by the decreased economic activity in 1975.

Table 3.—Production of manufactured graphite in the United States in 1975, by use

Use	Quantity (short tons)	Value (thousands)
Synthetic graphite products:		
Electrodes	177,048	$217,745
Crucibles and vessels	4,061	8,430
Motor brushes and machine shapes	618	2,403
Unmachined shapes	17,835	W
Cloth and fibers	168	W
Other [1]	50,718	52,845
Total	250,448	307,609
Synthetic graphic powder and scrap	27,589	1,758
Grand total	278,032	309,867

W Withheld to avoid disclosing individual company confidential data; included with "Total."

[1] Quantity includes anodes, refractories, high-modulus fibers, and other. Value includes anodes, unmachined shapes, cloth, fiber, high-modulus fibers, and other.

CONSUMPTION AND USES

Reported consumption for natural graphite declined 17% in 1975. Consumption in most categories declined in reflection of the general economic climate. Exports decreased to 10,600 tons. The Bureau of Mines canvass does not completely cover total consumption of natural graphite, which is estimated at approximately 70,000 tons of all types.

Economic conditions in 1975 made end use applications of reported manufactured graphite production difficult to estimate. Metallurgical use continued to be the principal consumer. It appears that electrodes and crucibles and vessels are the major end uses with unmachined shapes assuming greater importance. Graphite-fiber and carbon-fiber composites continued to gain consumer acceptance in the leisure product industries. Production costs of fiber decreased in 1975. The development of hybrid composites provided a combination of properties that extended the area of potential application. With the graphite fiber and hybrid composite fiber material available in broad woven form and with better fabrication techniques, assemblies became less labor intensive. Design and engineering began to emphasize cost as well as structural efficiency as the shift from development to production continued.

Table 4.—Consumption [1] of natural graphite in the United States in 1975, by use

(Short tons)

Use	Crystalline		Amorphous [2]		Total	
	Quantity	Value	Quantity	Value	Quantity	Value
Batteries	304	$465,091	387	$387,546	691	$852,637

Total	14,218	5,499,996	39,884	9,518,574	54,102	15,018,570

W Withheld to avoid disclosing individual company confidential data; included in "Total."

[1] Consumption data incomplete; excludes small consuming firms.

[2] Includes mixtures of natural and manufactured graphite.

[3] Includes bearings and carbon brushes; previously titled "Other mechanical products."

[4] Includes ammunition, packings, and seed coating.

[5] Includes paints and polishes, antiknock and other compounds, drilling mud, electrical and electronic products, insulation, magnetic tape, small packages, and miscellaneous and proprietary uses.

PRICES

Graphite prices increased again in 1975 as the demand for high-grade natural graphite continued strong. Domestic prices responded to the higher cost since most of the U.S. supply is imported. The price of Malagasy crystalline flake and fines increased an average of 42% in price during 1975. Sri Lanka amorphous lump and chip decreased 9%. Mexican graphite, the principal amorphous type imported, increased 25% in price.

Price quotations represent a range. Actual prices are often on a negotiated basis between the buyer and seller. One source of information for imported graphite is the average value per ton of the different classes of imports, which can be computed from table 6. However, it should be kept in mind that these represent mainly shipments of unprocessed graphite.

No published source of domestic price quotations has been found that reflects the increases that have taken place in the past several years. Price information can be obtained from the companies that produce and import natural graphite. The following tabulation shows representative prices of several types of imported graphite as of December 1975 published in the Engineering and Mining Journal. All prices are f.o.b. the foreign port or border station and have been converted from metric tons.

	Per short ton	
	1974	1975
Flake and crystalline graphite, bags:		
Germany, West	$234–$1,495	$250–$1,000
Malagasy Republic	188– 558	220– 750
Norway	150– 247	160– 260
Sri Lanka	248– 446	248– 446
Amorphous, nonflake cryptocrystalline graphite (80% to 85% carbon):		
Korea, Republic of (bags)	30	40
Mexico (bulk)	28.50	36

FOREIGN TRADE

Exports of natural graphite decreased 13% in 1975. The principal buyer was Canada, which took 2,707 tons. Other countries purchasing several hundred tons each were Australia, Brazil, France, West Germany, Japan, Mexico, the Netherlands, Philippines, Spain, the United Kingdom, and Venezuela. Graphite was also exported to 20 additional countries.

Imports of natural graphite of all types decreased 21%. Imports of amorphous graphite from Mexico decreased 21% from 1974. Imports of crystalline flake from the Malagasy Republic increased 320 tons to 3,698 tons in 1975. The demand for refractory- and crucible-grade crystalline flake was active, but appears to have decreased somewhat.

Table 5.—U.S. exports of natural graphite,[1] by country

Destination	1974 Quantity (short tons)	1974 Value	1975 Quantity (short tons)	1975 Value

WORLD REVIEW

World production of natural graphite decreased 10%. Production of amorphous graphite in Mexico and the Republic of Korea continued to be adequate. The shortage of Malagasy crystalline flake appears to have eased somewhat. Industry continued to look for sources of crystalline flake other than the Malagasy Republic.

Table 7.—Graphite: World production, by country

[e] Estimate. [p] Preliminary. [r] Revised. W Withheld to avoid disclosing individual company confidential data.

[1] In addition to the countries listed, Czechoslovakia, Japan, Southern Rhodesia, and the Territory of South-West Africa are believed to produce graphite, but available information is inadequate for formulation of reliable estimates of output levels.

[2] Beneficiated product.

[3] Data for year Apr. 1, 1974, through Mar. 31, 1975.

[4] Represents marketable production, including some imported graphite.

[5] Exports.

TECHNOLOGY

A small, integrated plate or hot strip mill now appears economically feasible because it bypasses much of the equipment and processes used in conventional steelmaking. The key elements of these miniworks are direct reduction of iron ore to provide the major portion of iron for melting; electric arc furnaces to convert the cold iron into liquid steel, and controlled pressure pouring (CPP) to convert the molten steel into slabs for rolling. An essential part of the process is the use of large machined graphite blocks as slab molds. Metal cast into the coated graphite mold gives a slab with excellent surface qualities.[2]

Use of graphite-alumina refractories developed by Vesuvius Crucible Co., Pittsburgh, Pa., for continuous casting of alloy steel maintains the quality of the as-cast metal. The refractories have good mechanical strength and high thermal conductivity to resist thermal shock. The system maintains the quality of the alloy by protecting the molten metal from the atmosphere as the metal is passed from the ladle, to the tundish, to the headbox of the continuous casting machine.

Graphite and carbon fibers increased in importance as research and development continued and the shift to production items accelerated. A full-scale aircraft wing of advanced composites built to McDonnell-Douglas F-15 wing specifications was static tested. It was concluded that large composite wings can withstand mechanical loads identical to those experienced by metal wings. The composite wing was 10% lighter in weight, and indications are that it would cost less to fabricate.[3] An Air Force study known as the Advanced Design Composite Aircraft was announced. The goal of the study is to create the design of a new aircraft that would have up to 70% of its airframe made by graphite composites. The project is managed by the Flight Dynamics Laboratory at Wright-Patterson Air Force Base.[4]

An advanced low-thrust rocket motor developed by Jet Propulsion Laboratories has a graphite-epoxy combustion chamber. Overall dimensions of the motor case are 25.6 inches in diameter and 26 inches long. NASA/Lewis developed a hybrid composite material composed of graphite epoxy and boron aluminum interspersed with titanium metal foil. The material showed improved strength and stiffness for multidirectional loading, improved resistance to cyclic loading, and improved impact and erosion resistance.[5]

An interesting review of fiber composites outlined the various types of composites presently used; including their advantages, disadvantages, and present and potential applications.[6]

A comparison of inorganic fibers was published. The basic properties and available forms of major inorganic manmade fibers are listed and compared. The confusion over carbon and graphite fibers is clarified.[7]

Thagard Technology Co. has developed an unusual high-temperature reactor. Heat is transferred via radiation instead of convection or conduction. Various gases serve as a blanketing fluid to protect the internal walls of the reaction tube from the reactants and their products. Heat shields, spiral heat exchangers, insulation, and reaction tubes are fabricated from various forms of carbon and graphite fibers. The temperature of the reactor is easily controlled, and the tube temperature responds quickly to any change in the thermal load of the entering reactants.[8]

A graphite resistance furnace with a very low thermal mass having accurate temperature control and capable of precision drawing silica-based fibers at temperatures up to 2,000° C was constructed. Working temperatures were reached in a very short time. Power consumption was low, and recovery from transient temperature disturbances was rapid. The entire furnace was constructed of various forms of graphite products including felt, string, cloth, paper, and machined graphite. The apparatus was strong and reliable in operation and was considered suitable for routine production operations.[9]

A composite paint extender of mica with 5% contained graphite was produced by Micalith Mining Co. of Phoenix, Ariz. The product is claimed to be suitable for use in anticorrosive systems for imparting strength and adhesion.[10]

A new self-lubricating, dry bearing material consists of high-purity powders alloyed into a strong graphite-impregnated bronze matrix. The material is said to be impervious to nearly all solvents and foreign matter. It can operate at sustained temperatures up to 1,000° F.[11]

The first International Titanium Casting Seminar was held in London. The "Mono-Graf" graphite shell casting system was described. Six U.S. companies produce titanium castings; three use the rammed graphite technique, and the others use the investment process.[12]

Gypsum

By Avery H. Reed[1]

The gypsum industry continued to decline in 1975 owing to the continued depression in the building industries. Output of crude gypsum declined 19% to 9.8 million tons. Production of calcined gypsum declined 16% to 9.2 million tons. Sales of gypsum products declined 17% to 15.6 million tons. Imports of crude gypsum declined 27% to 5.4 million tons. Total value of gypsum products sold declined 18% to $514 million.

Domestic demand for gypsum is expected to increase 2% per year and reach 35 million tons by 2000.

[1] Each mine, calcining plant, or combination mine and plant is counted as one establishment.
[2] Excludes byproduct gypsum.

DOMESTIC PRODUCTION

Thirty-nine companies mined crude gypsum at 68 mines in 22 States. Output declined 19% and was 28% below the 1973 record. Leading producing States were California, Michigan, Iowa, Texas, and Oklahoma. These five States each produced more than 1 million tons and together accounted for 62% of total domestic production. Stocks of crude ore at mines at yearend were 1.0 million tons.

Leading companies were United States Gypsum Co. (14 mines), National Gypsum Co. (7 mines), Georgia-Pacific Corp. (6 mines), Celotex Corp. (4 mines), Flintkote Company (3 mines), and H. M. Holloway Inc. (1 mine). These 6 companies, operating 35 mines, produced 79% of the total crude gypsum.

Leading individual mines were United States Gypsum's Plaster City mine in Imperial County, Calif.; National Gypsum's Tawas mine in Iosco County, Mich.; H. M. Holloway's Lost Hills mine in Kern County, Calif.; United States Gypsum's Southard mine in Blaine County, Okla.; and United States Gypsum's Shoals mine in Martin County, Ind. These five mines accounted for 27% of the national total. Average output per mine for the 68 U.S. mines was 143,000 tons, compared with 160,000 tons per mine in 1974 and 196,000 tons in 1973.

---

[1] Supervisory physical scientist, Division of Nonmetallic Minerals.

Thirteen companies calcined gypsum at 74 plants in 29 States. Output declined 16% and was 27% below the 1973 record. Leading States were California, Iowa, Texas, New York, and Indiana. These 5 States, with 28 plants, accounted for 44% of the national total.

Leading companies were United States Gypsum Co. (23 plants), National Gypsum Co. (18 plants), Georgia Pacific Corp. (9 plants), Flintkote Company (6 plants), and Celotex Corp. (5 plants). These 5 companies, operating 61 plants, accounted for 87% of the national total.

Leading individual plants were United States Gypsum's Plaster City plant, Imperial County, Calif.; United States Gypsum's Shoals plant, Martin County, Ind.; United States Gypsum's Stony Point plant, Rockland County, N. Y.; United States Gypsum's Southard plant, Blaine County, Okla.; National Gypsum's Shoals plant, Martin County, Ind.; United States Gypsum's Ft. Dodge plant, Webster County, Iowa; and Weyerhauser's Briar plant, Howard County, Ark. These seven plants accounted for 21% of the national total. Average output per plant for the 74 U.S. plants was 124,000 tons, compared with 145,000 tons per plant in 1974 and 166,000 tons in 1973.

Occidental Petroleum Corp., Valley Nitrogen Producers Inc., Collier Carbon & Chemical Corp., and California Industrial Minerals Co., (all in California); and Universal Gypsum Co. of Indiana Inc., in Indiana, sold 369,000 tons of byproduct gypsum valued at $2.9 million for agricultural purposes.

The United States is the world's leading producer of gypsum, accounting for 16% of total world output.

CONSUMPTION AND USES

Apparent consumption of crude gypsum (production plus imports minus exports) declined 22% to 15.2 million tons. Imports provided 36% of consumption. Apparent consumption of calcined gypsum declined 16% to 9.1 million tons.

Stocks of crude gypsum at mines and calcining plants at yearend were 2.9 million tons. Of this, 1.7 million tons (59%) was at calcining plants in coastal States.

Of the total gypsum products sold or used, 4.9 million tons (31%) was uncalcined. Of the total uncalcined gypsum, 3.2 million tons (66%) was used for portland cement, and 1.5 million tons (30%) was used in agriculture. The leading sales regions for gypsum used in cement were the West South-Central, West North-Central, and Pacific; the three regions accounted for 44% of the total. For agricultural gypsum, the Pacific sales region accounted for 82% of the total.

Of the total calcined gypsum, 92% was used for prefabricated products and 8% for plasters. Of the prefabricated products, 76% was regular wallboard, 16% was fire-resistant Type X wallboard, and only 1% was lath. Of the regular wallboard, 82% was ½ inch and 10% was ⅝ inch. The leading sales regions for prefabricated products were the South Atlantic, East North-Central, and the Pacific; the three regions accounted for 48% of the total. For plaster, the East North-Central, Middle Atlantic, and South Atlantic regions accounted for 60% of the total.

PRICES

The value of crude gypsum increased from $4.41 per ton in 1974 to $4.58 in 1975. The value of calcined gypsum increased from $18.71 in 1974 to $20.31 in 1975. The average value of byproduct gypsum sold decreased from $9.29 to $7.96 per ton in 1975.

The average value of gypsum products sold or used decreased from $33.33 to $32.95 per ton in 1975. Prefabricated products were valued at $44.96, industrial plasters at $50.50, building plaster at $42.27, and uncalcined products at $6.74 per ton.

Quoted prices for gypsum are published monthly in Engineering News-Record. Prices at yearend showed a wide range, based on delivered prices. Regular ½-inch wallboard prices ranged from $44 per thousand square feet at Dallas to $90 at Chicago. Prices for building plaster ranged from $68 per ton at Philadelphia to $94 at Denver.

FOREIGN TRADE

The gypsum industry depended on imports in 1975 for 36% of the crude gypsum supply. Imports were from Canada (74%), Mexico (19%), Jamaica (5%), and the Dominican Republic, the United Kingdom, and Italy (2%). Imports decreased 27% to 5.4 million tons. Most of the imported crude gypsum was mined by U.S. companies.

WORLD REVIEW

Domestic and foreign resources of gypsum are adequate for any foreseeable time. World reserves are conservatively estimated at 2 billion tons.

Canada.—Canada was the third leading producer of crude gypsum, accounting for 10% of the world total. Most of the gypsum was mined by U.S. companies and exported to the United States.

France.—France was the second leading gypsum producing country, with 11% of the world total.

South Africa.—Gypsum reserves in Cape Province were reported to be "too extensive to justify the time required to arrive at a total tonnage." Gypsum beds range from 3 to 7 feet thick and average 70% gypsum. The gypsite is upgraded to 90% gypsum by washing out the clay. Production is used locally.

Spain.—Spain ranked fifth in world gypsum production with 8% of the total.

U.S.S.R.—The U.S.S.R. produced 9% of the world's gypsum and ranked fourth.

Yugoslavia.—Construction started on a $1.4 million gypsum plant at Donji Vakuf, Bosnia.

Helium

By Thomas G. Clarke [1]

In 1975, total domestic sales of high purity helium (minimum 99.995% purity) increased 5% to 601 million cubic feet, compared with 570 million cubic feet in 1974.[2] The Bureau of Mines plants sold 31% of the 1975 total, and private industry accounted for the remainder. Exports of high purity helium in 1975, all by industry, were 144 million cubic feet, 12% higher than in 1974. The Bureau of Mines plant price remained at $35 per thousand cubic feet in 1975, but private industry prices rose slightly to $24 per thousand cubic feet.
